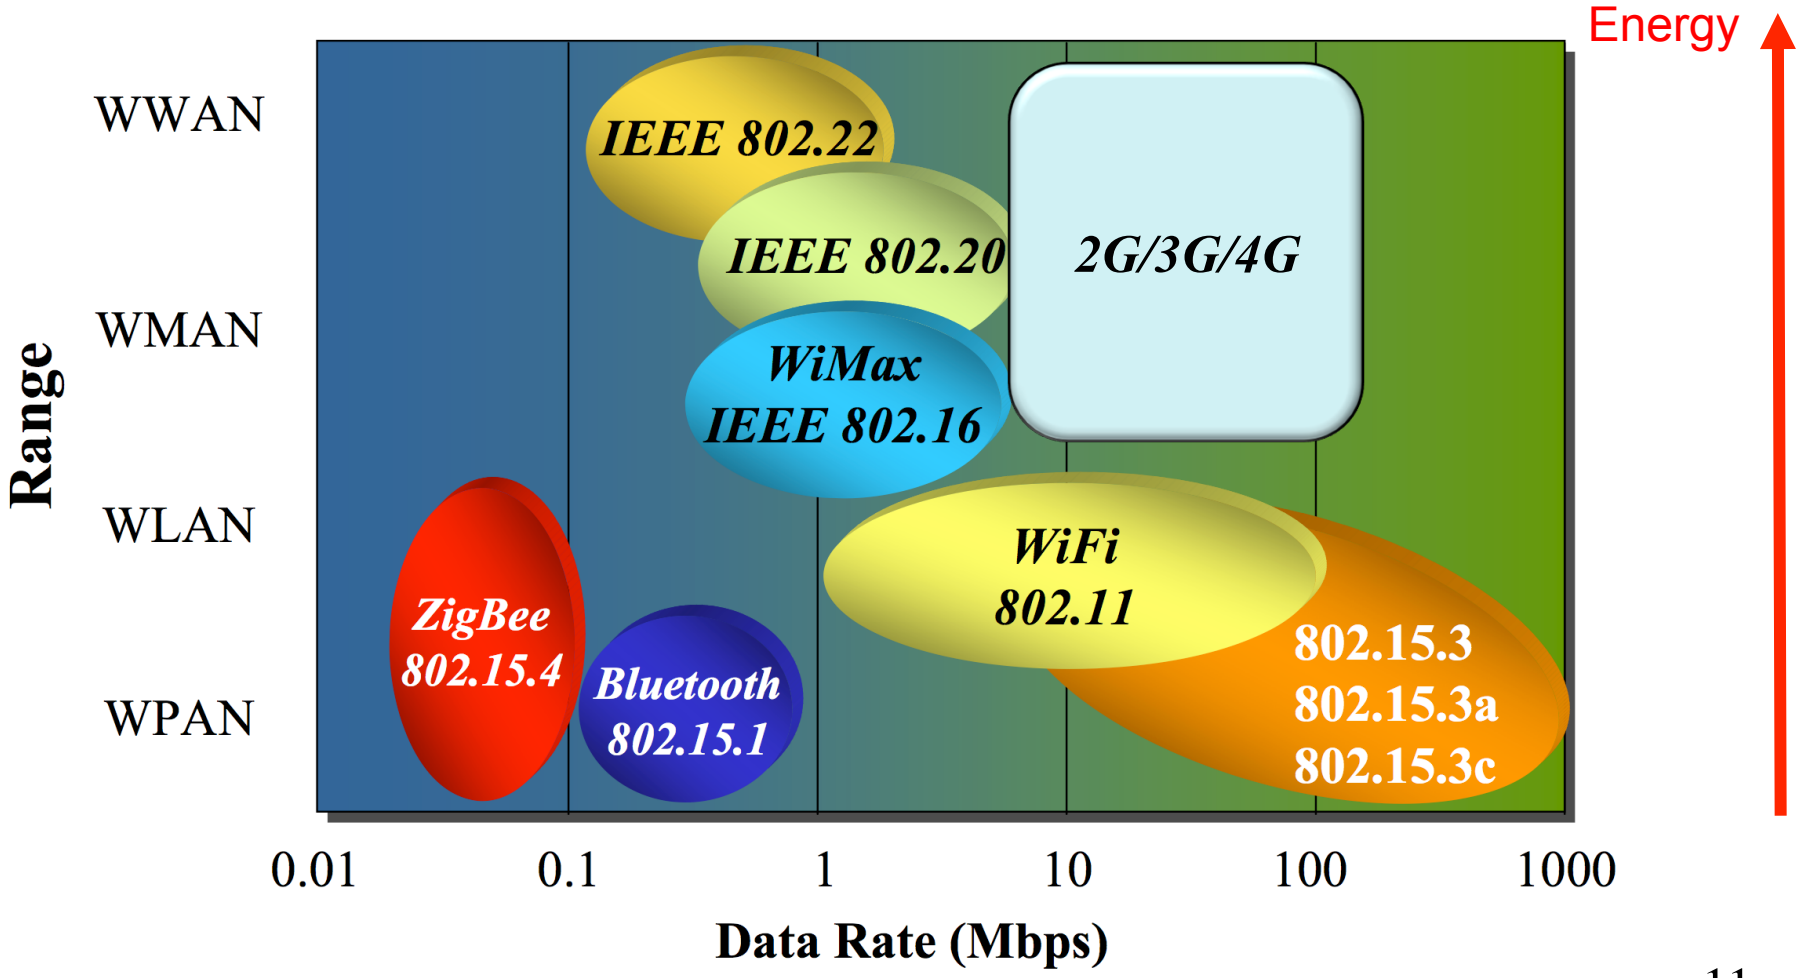
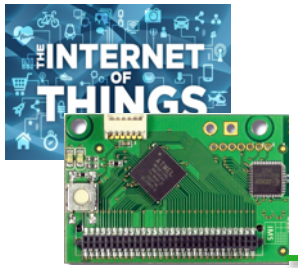
THE WIRELESS SPACE

Energy-Range dilemma

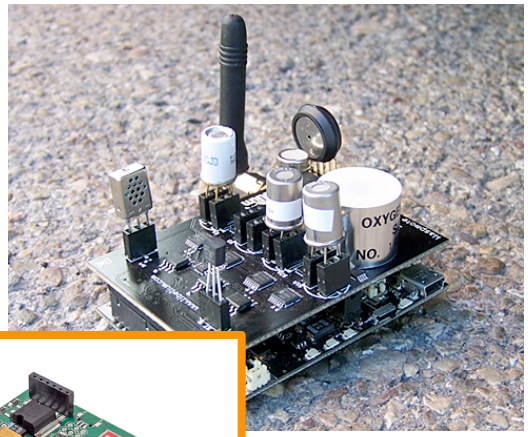


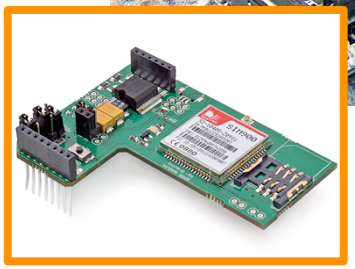


How costly is transmission?

Technology	2G	3G	LAN
Range (I=Indoor, O=Outdoor)	N/A	N/A	O: 300m I: 30m
Tx current consumption	200-500mA	500-1000mA	100-300mA
Standby current	2.3mA	3.5mA	NC

Energy consideration





18720 Joules

TX power: 500mA

P = I x V = 500 x 3.3 = 1650mW

E = P x t -> t = E/P

11345s or 3h9mins

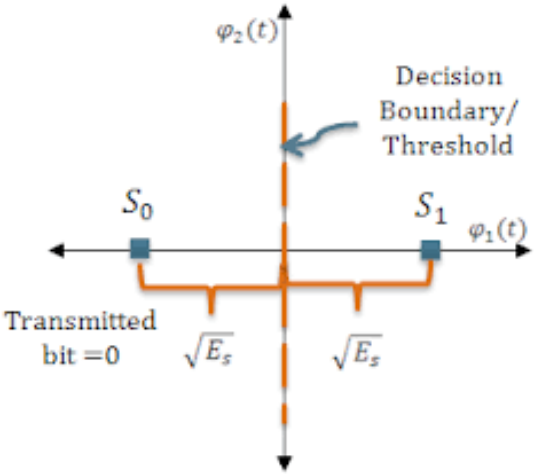
Technology	2G	3G
Range (I=Indoor, O=Outdoor)	N/A	N/A
Tx current consumption	200mA-500mA	500mA – 1000mA
Standby current	2.3mA	3.5mA

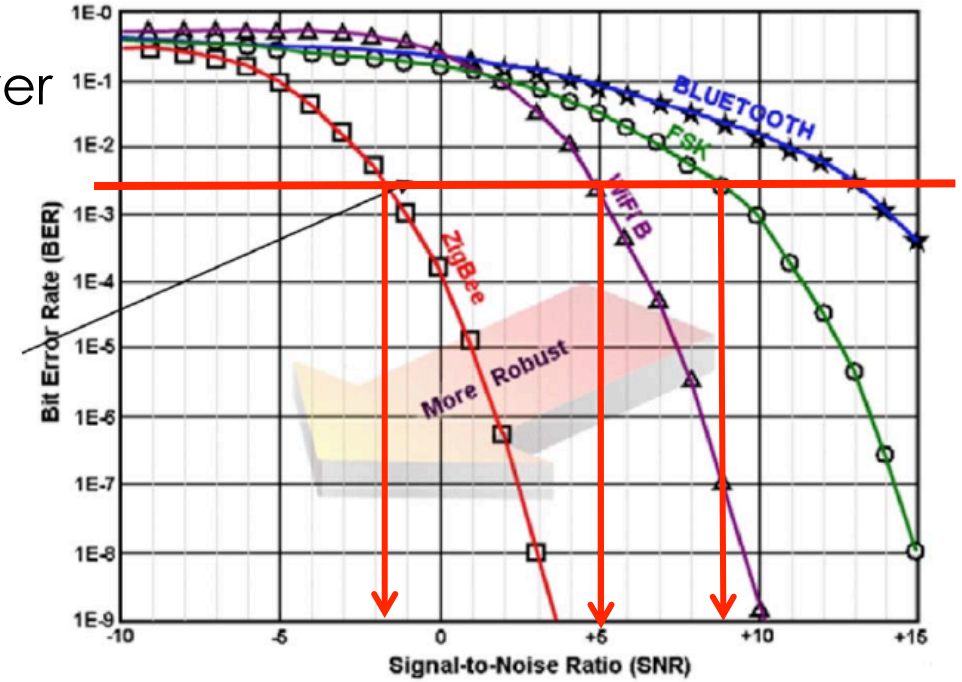
Haven't considered:

- Baseline power consumption of the sensor board
- RX consumption!
- Event capture consumption
- Event processing consumption

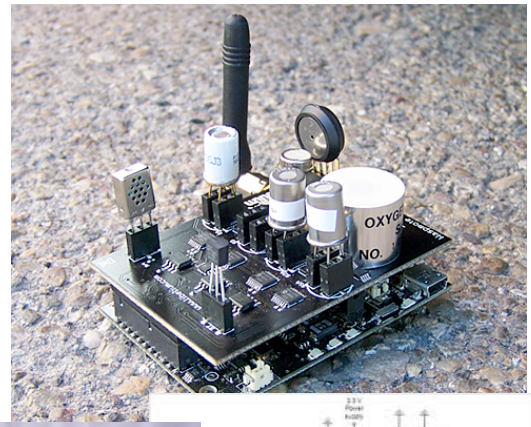
IEEE 802.15.4 in ISM 2.4GHz

- Low-power radio in the 2.4GHz band offering 250kbps throughput at physical layer
- Power transmission from 1mW to 100mW for range from 100m to about 1km is LOS
- CSMA/CA
- BPSK, used as physical layer in ZigBee





Energy consideration



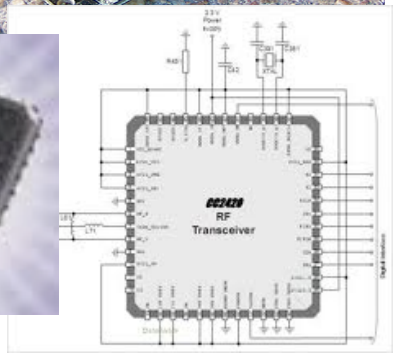
18720 Joules

TX power 0dbm: 17.4mA

P = I x V = 17.4 x 3.3 = 57.42mW

E = P x t -> t = E/P

326018s or 90.5h



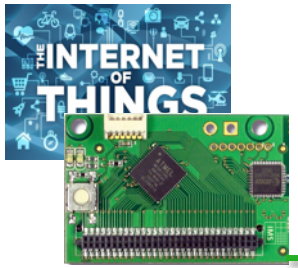
Chipcon Products from Texas Instruments

CC2420

Parameter	Min.	Typ.	Max.	Unit	Condition / Note
Current Consumption, transmit mode:					
P = -25 dBm		8.5		mA	The output power is delivered differentially to a 50 Ω singled ended load through a balun, see also page 55.
P = -15 dBm		9.9		mA	
P = -10 dBm		11		mA	
P = –5 dBm		14		mA	
P = 0 dBm		17.4		mA	

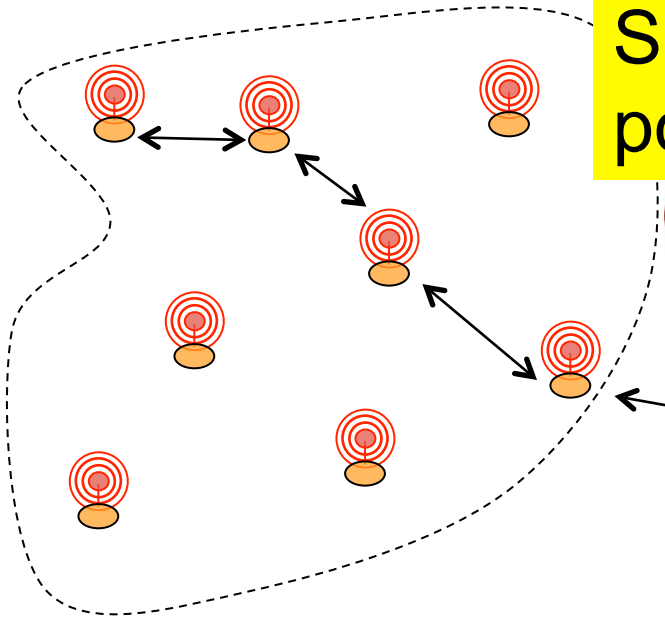
Haven't considered:

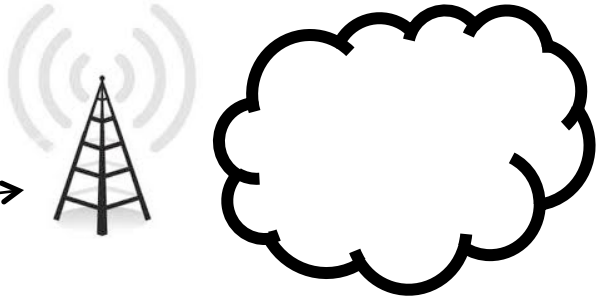
- Baseline power consumption of the sensor board
- RX consumption: 18.8mA!
- Event capture consumption
- Event processing consumption



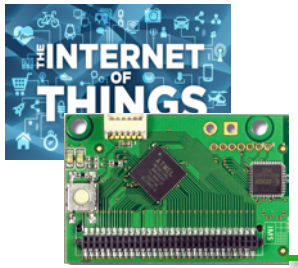
Lower energy means shorter range!

Short range, low power radio



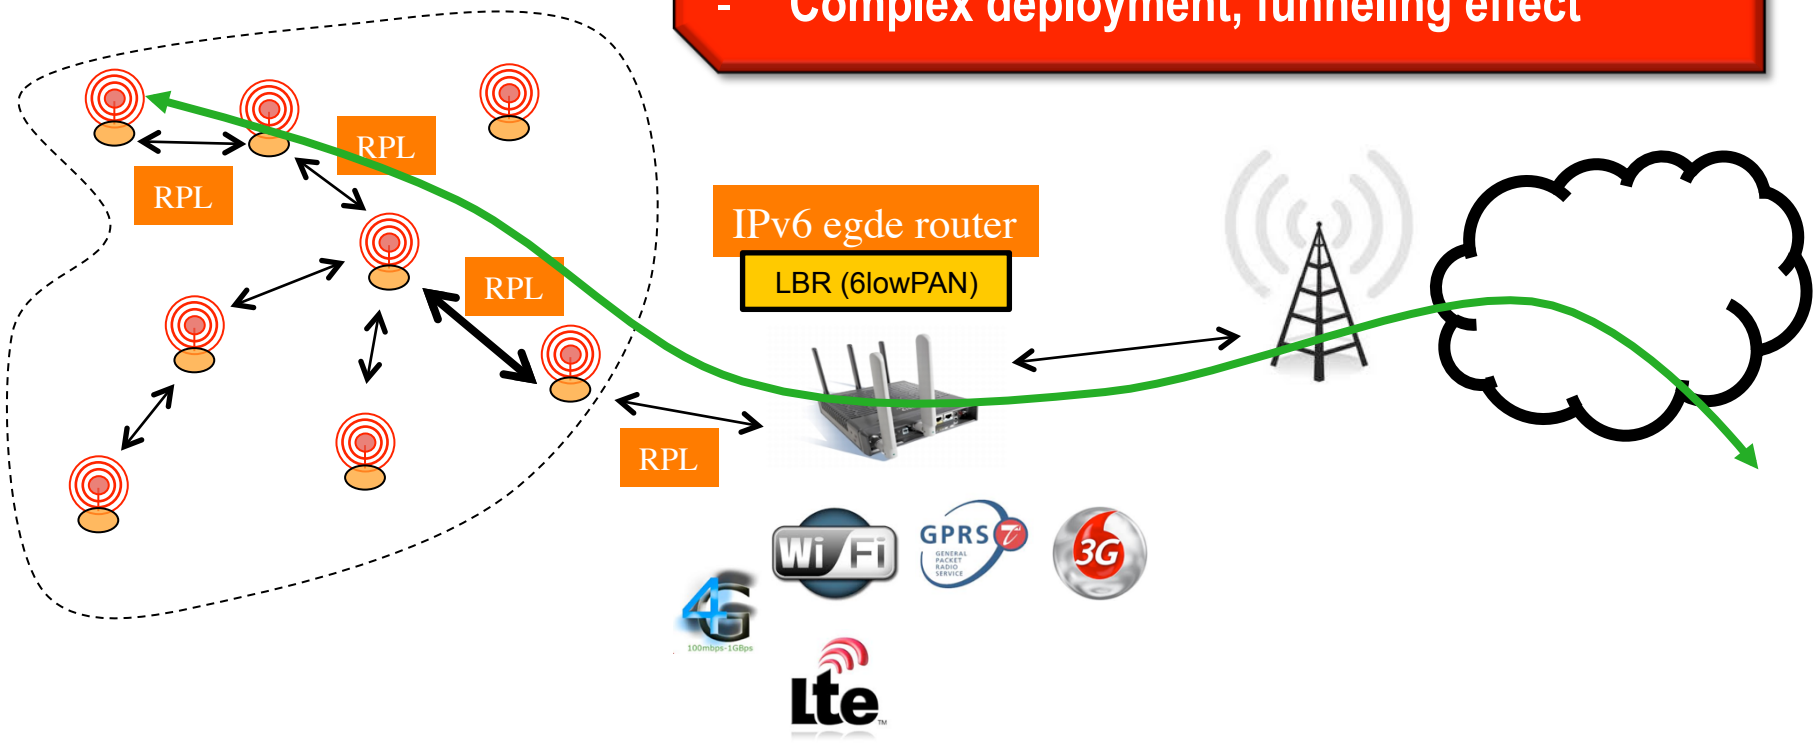


- Routing issues
- Medium Access issues



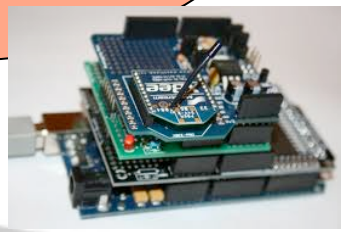
15 YEARS OF MULTI-HOP ROUTING?

- High packet loss rates
- Needs synchonization when duty-cycling
- Complex deployment, funneling effect

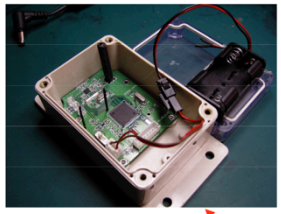


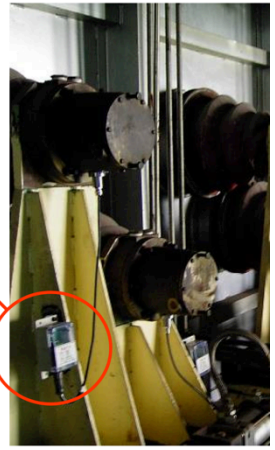
Academics vs Industries
Let's go back to reality!

Millions of sensors, self-organizing, self-configuring, with QoS-based multi-path routing, mobility, and …



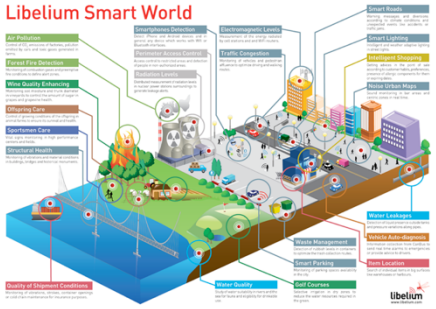
500 sensors, STATIC deployment, but need to have RELIABILITY, GUARANTEED LATENCY for monitoring and alerting. MUST run for 3 YEARS. No fancy stuff! CAN I HAVE IT?

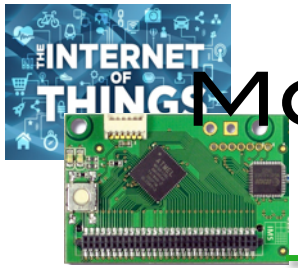




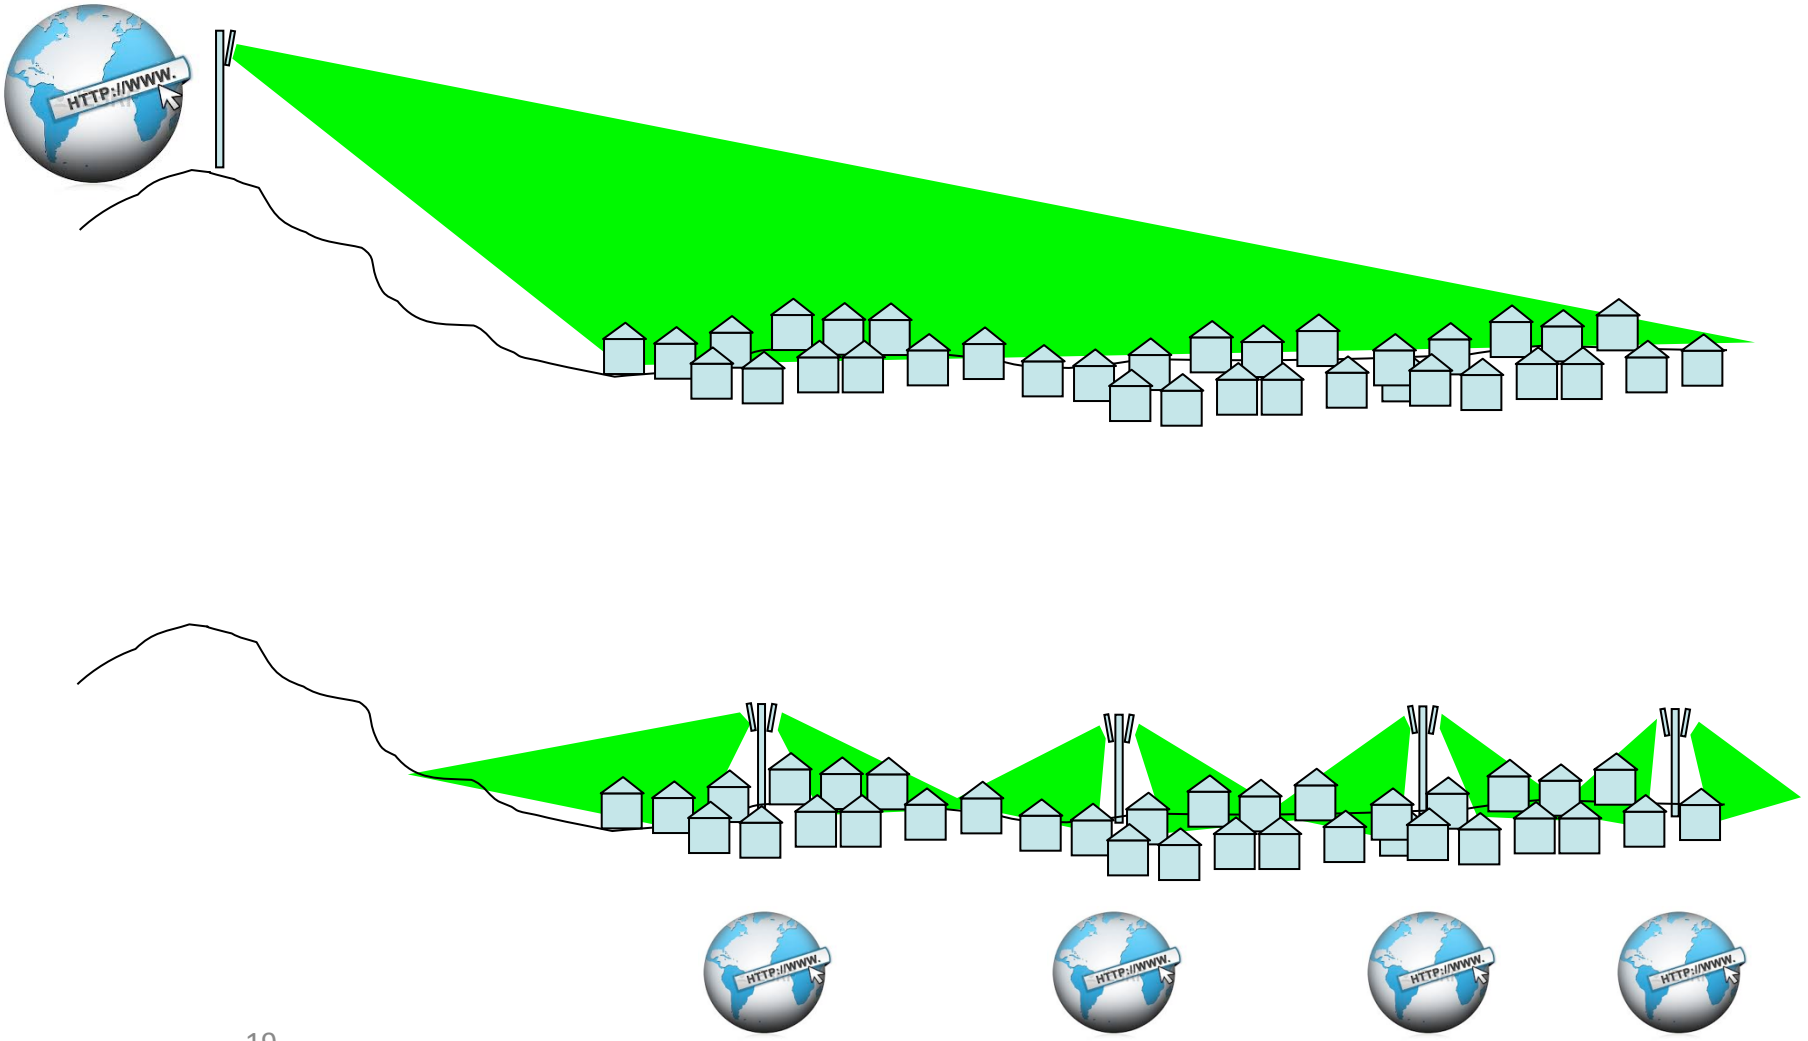
- Placement constraints
- Lifetime constraints

From Peng Zeng & Qin Wang

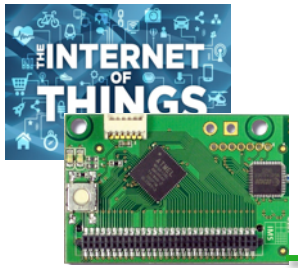




Most telemetry applications use the cellular model

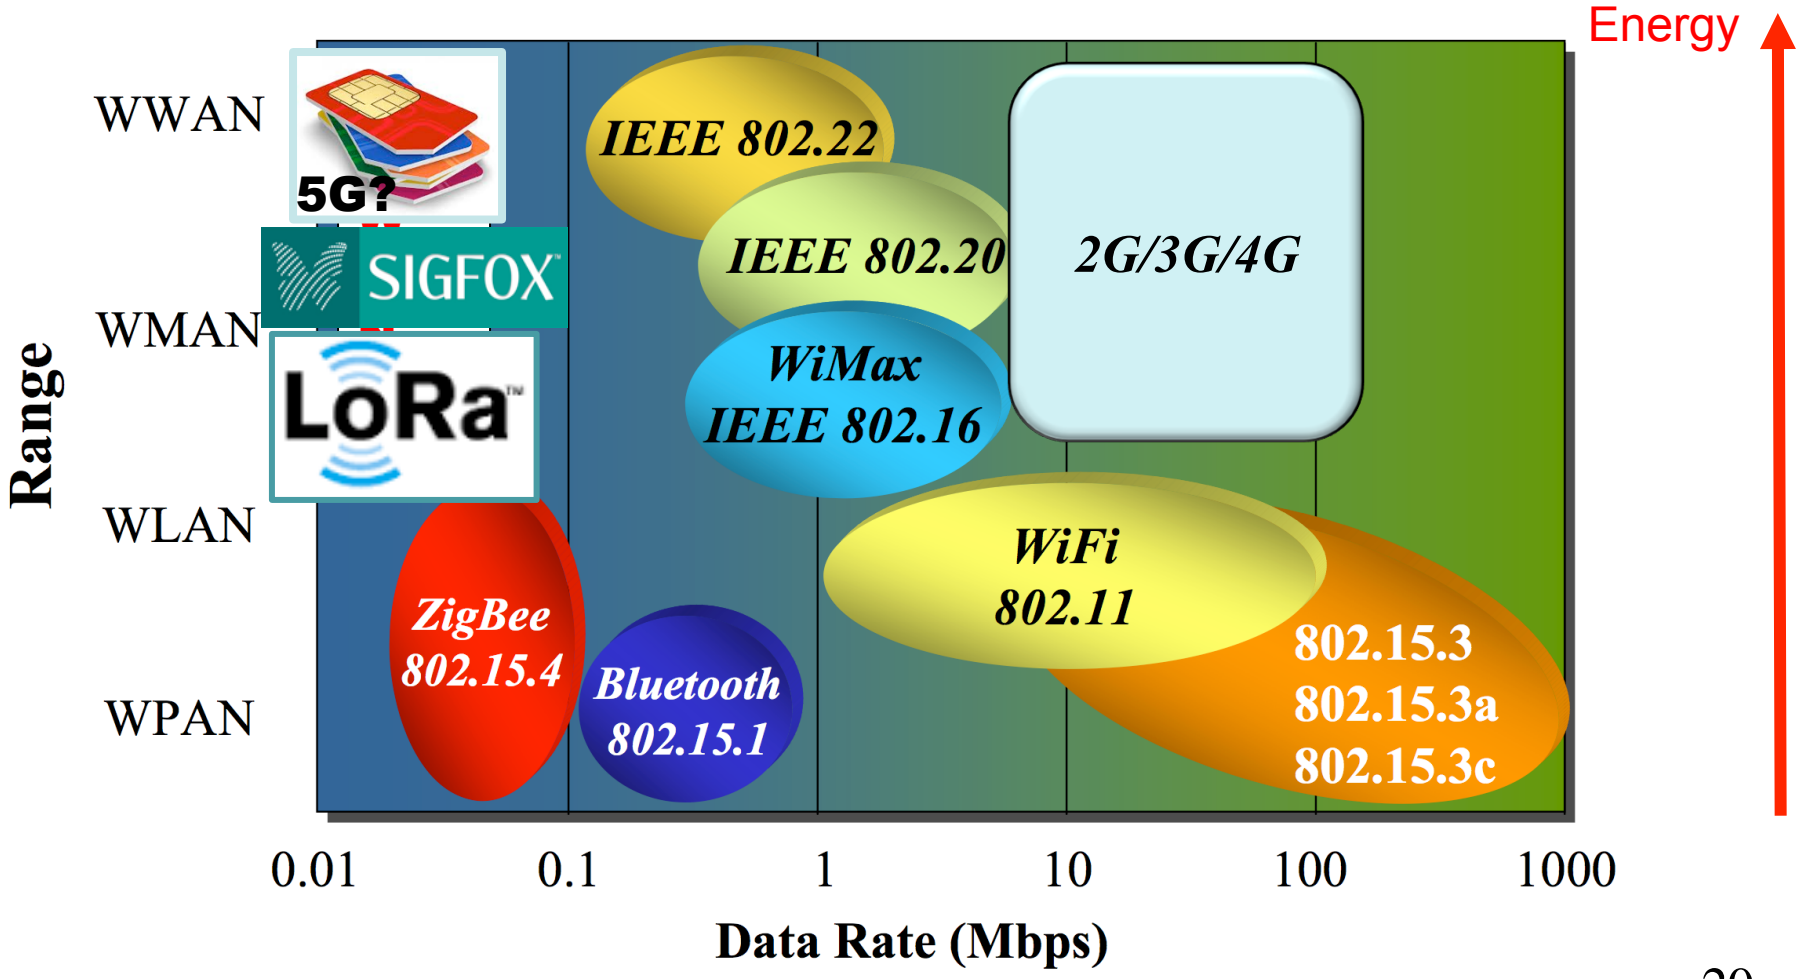


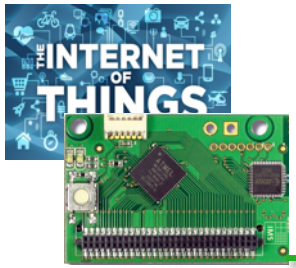
19



Low-power and long-range?

Energy-Range dilemma

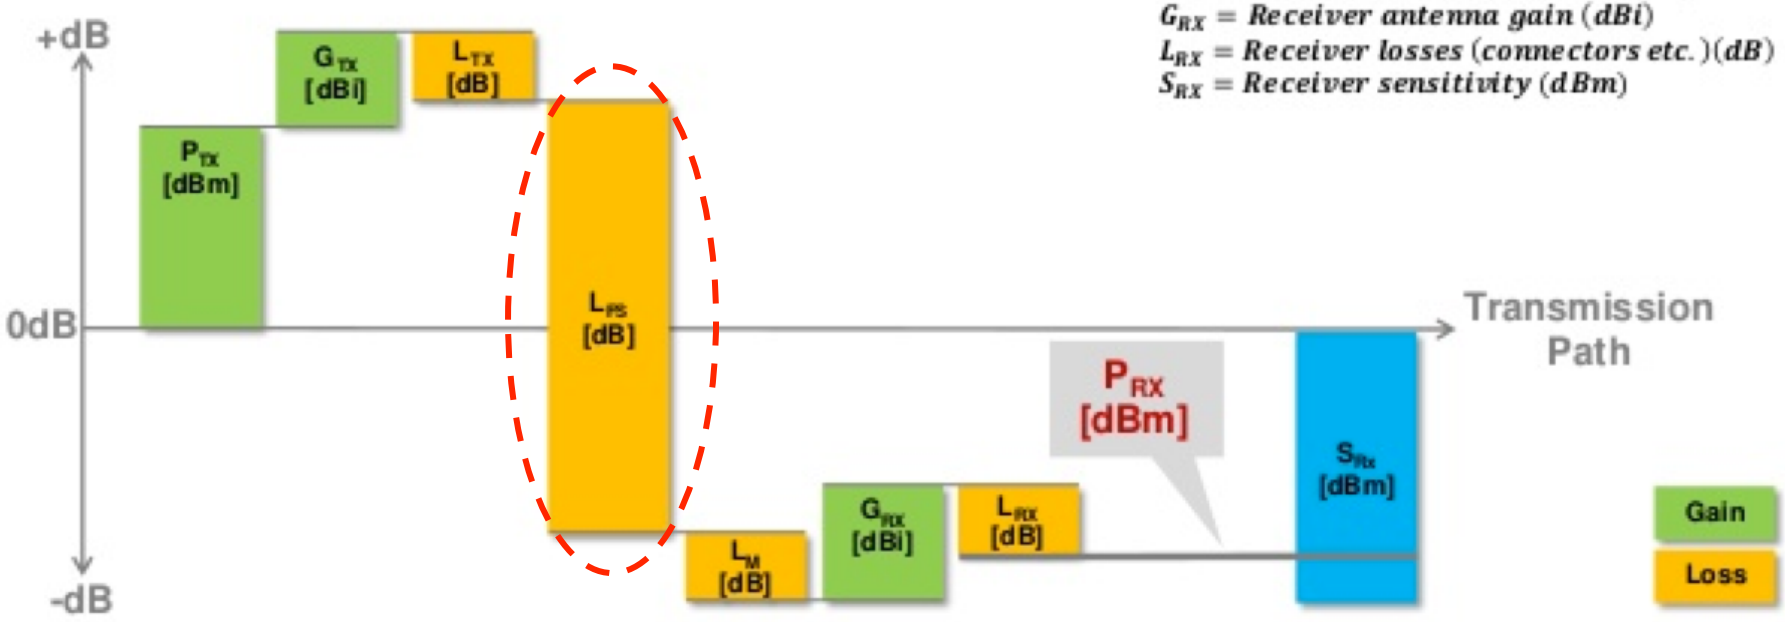




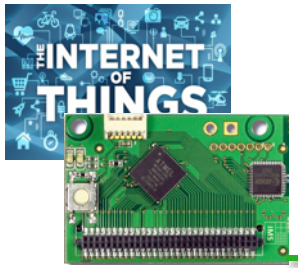
LINK BUDGET OF LPWAN

$$P_{RX} = P_{TX} + G_{TX} - L_{TX} - L_{FS} - L_M + G_{RX} - L_{RX}$$

P_{RX} = Received power (dBm)
P_{TX} = Sender output power (dBm)
G_{TX} = Sender antenna gain (dBi)
L_{TX} = Sender losses (connectors etc.)(dB)
L_{FS} = Free space loss (dB)
L_M = Misc. losses (multipath etc.)(dB)
G_{RX} = Receiver antenna gain (dBi)
L_{RX} = Receiver losses (connectors etc.)(dB)
S_{RX} = Receiver sensitivity (dBm)

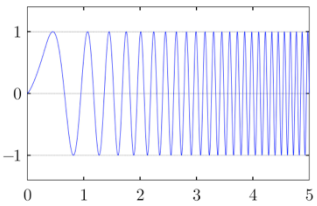


From Peter R. Egli, INDIGOO.COM

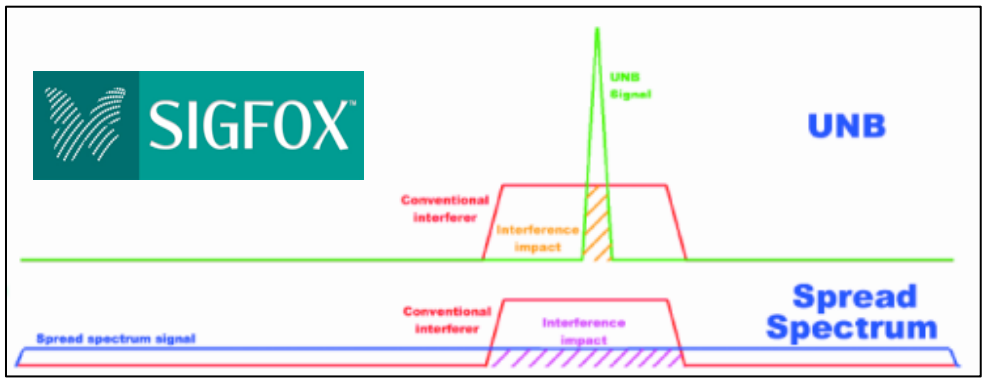


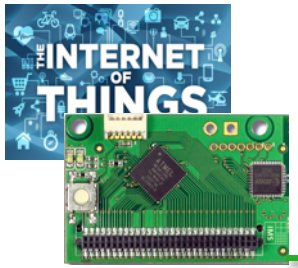
Increasing range?

- Generally, robustness and sensitivity can be increased when transmitting much slower
- A Sigfox message is sent relatively slowly in a very narrow band of spectrum. Max throughput=~100bps
- LoRa also increases time-on-air when maximum range is needed. But LoRa uses spread spectrum instead of UNB. throughput=~300bps-37.5kbps



LoRa™





Simple loss in signal strength model

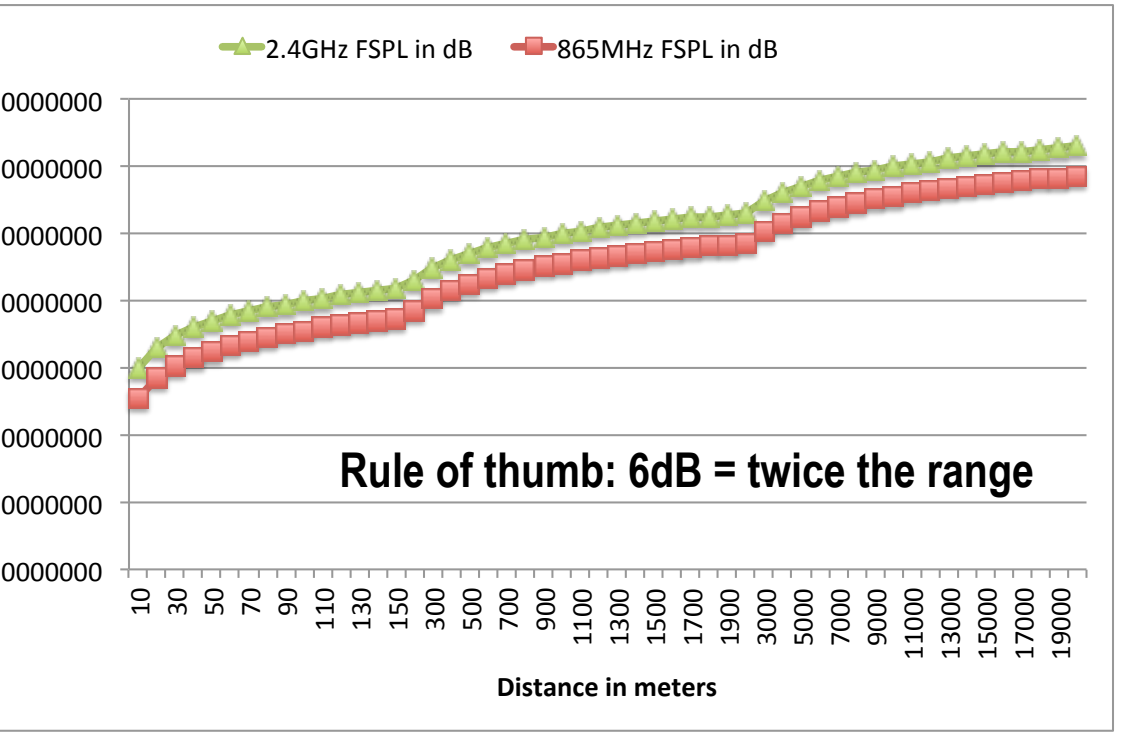
$$\text{FSPL} = \left(\frac{4\pi d}{\lambda}\right)^2 = \left(\frac{4\pi df}{c}\right)^2 \qquad FSPL = \frac{P_t}{P_r} G_t G_r$$

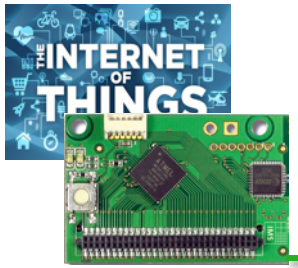
- Free Space Path Loss model

$$L_{(dB)} = 10\log\left(\frac{P_t}{P_r}\right) = 20\log\left(\frac{4\pi d}{\lambda}\right) = 20\log\left(\frac{4\pi fd}{c}\right)$$

$$L_{(dB)} = 20\log(f) + 20\log(d) - 147{,}55\ dB$$

FSPL assume Gt=Gr=1



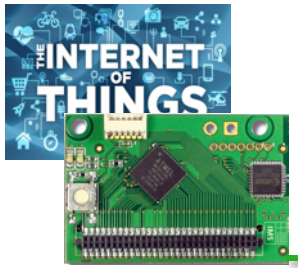


LINK BUDGET EXAMPLE

- Received Power (dBm) = Transmitted Power (dBm) + Gains (dB) – Losses (dB) [mainly FSL]
- Example
  - Transmitted power is +14dBm (25mw)
  - Losses is 120dB
  - Then Receiver Power (dBm) is -106dBm
- If you have a receiver sensitivity of -137dBm you can handle FSPL up to 151dB!
- Rewriting the equation
  - Losses (dB) = Transmitted Power (dBm) - Received Power (dBm)
  - Losses = link budget & Received Power = max receiver sensitivity
  - Link budget = Transmitted Power - max receiver sensitivity
  - **151dB=14dBm - (-137dBm)**

dBm – **power referred to 1 mW,**

$P_{dBm}=10\log(P/1mW)$



LINK BUDGET EXAMPLE

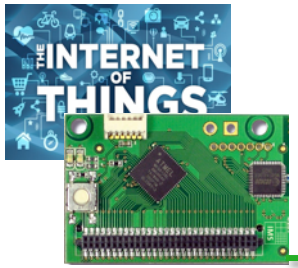
- Received Power (dBm) = Transmitted Power (dBm) + Gains (dB) – Losses (dB) [mainly FSL]
- Example
  - Transmitted power is +14dBm (25mw)
  - Losses (FSPL) is 1
  - Then Receiver P
- If you have a rece
  handle FSPL up to
- Rewriting the equ
  - Losses (dB) = Trans
  - Losses = link budg
  - Link budget = Tran
  - **151dB=14dBm - (-**

dBm – power referred to 1 mW,

$P_{dBm}=10\log(P/1mW)$

KEY PRODUCT FEATURES

- LoRa™ Modem
- 157 dB maximum link budget
- +20 dBm at 100 mW constant RF output vs. V supply
- +14 dBm high efficiency PA
- Programmable bit rate up to 300 kbps
- High sensitivity: down to -137 dBm



Low Power WAN ?

Tables from Semtech

Technology	2G	3G	LAN	ZigBee	Lo Power WAN

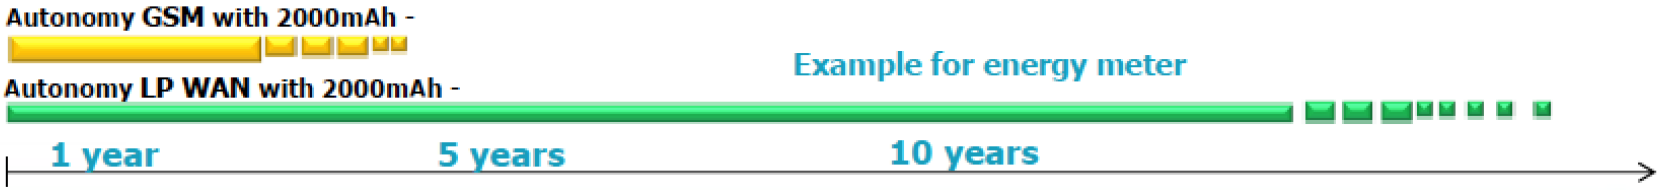
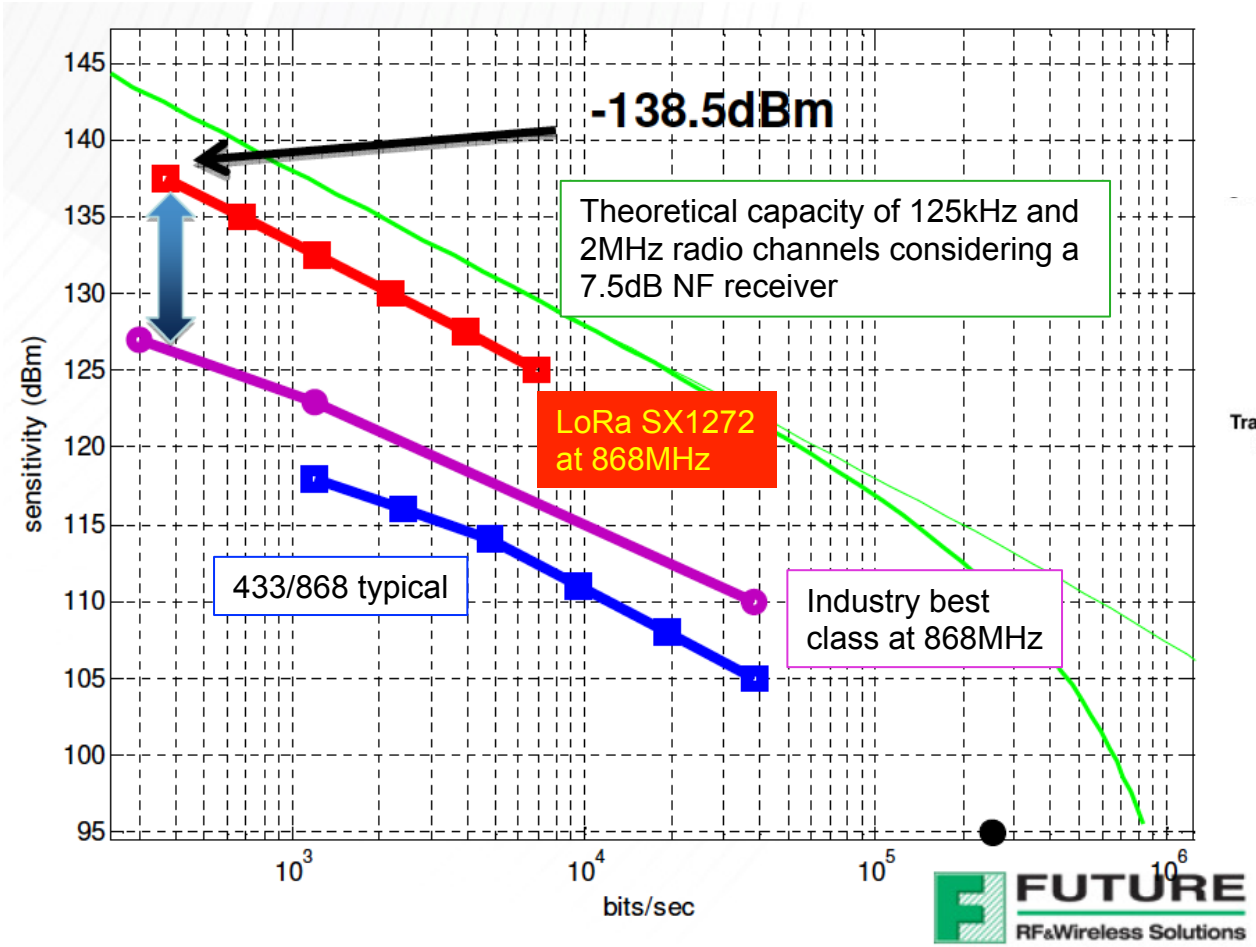
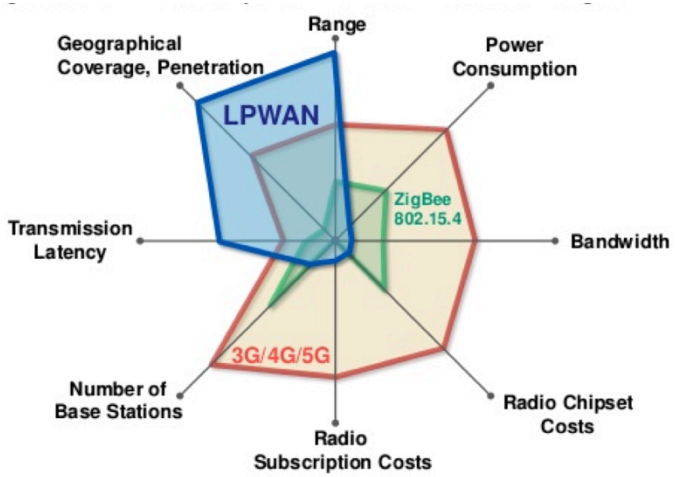
Module Revenue Annually	12 $	20 $	4 $	$3	3 $



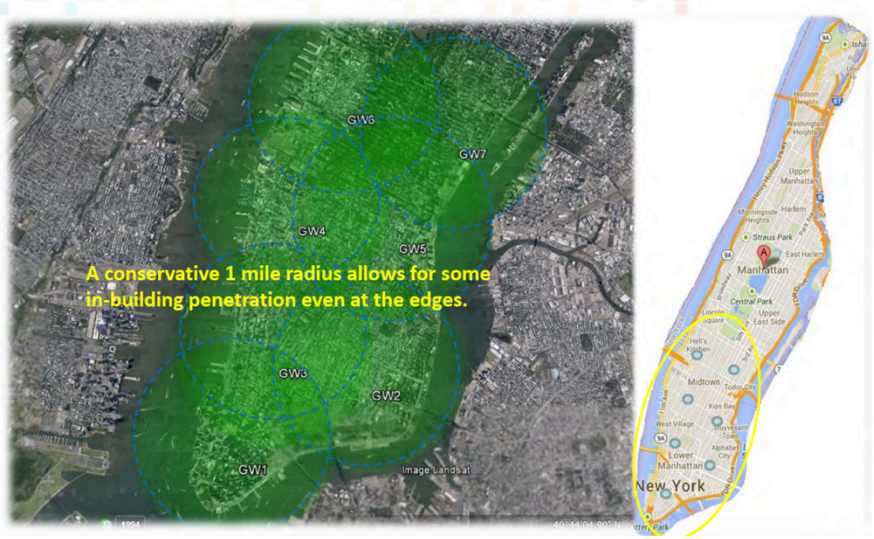
WHY THE LPWAN REVOLUTION?





From Peter R. Egli, INDIGOO.COM

Versatile LPWAN!



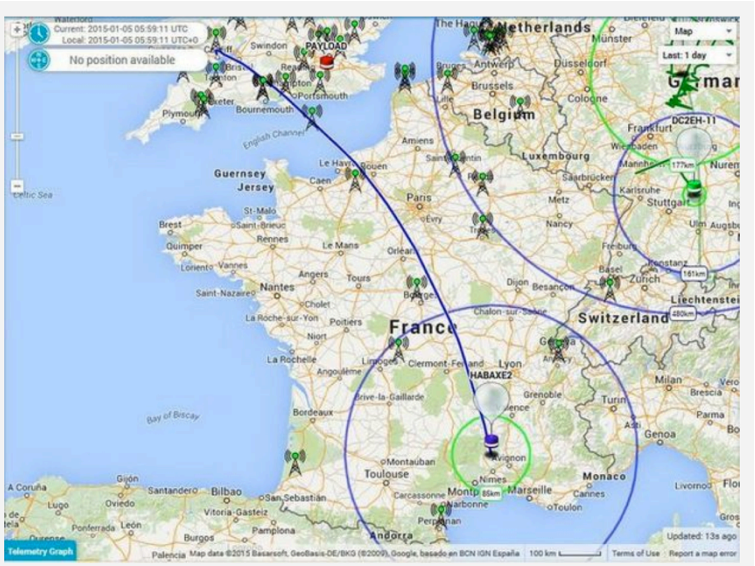
Dense urban areas

Rural areas

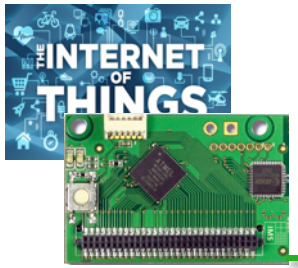
Indoor

Underground

The higher the better!



UK HAB (High Altitude Ballooning) trials gave 2 way LoRa™ coverage at up to 240 km. Lowering the data rate from 1000bps to 100bps should allow coverage all the way to the radio horizon, which is perhaps 600 km at the typical 6000-8000m soaring altitude of these balloons. Balloon tracking can be made



The price to pay!

Very low throughput
Transmission time can be several seconds

Range ↕ Throughput

				time on air in second for payload size of

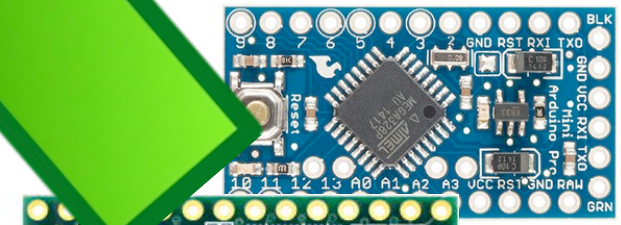
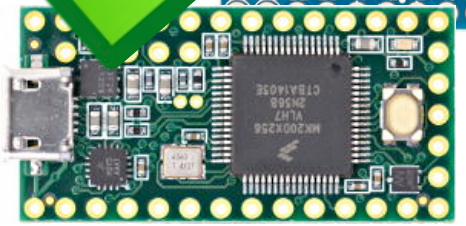
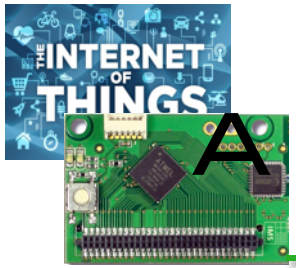
The INTERNET of THINGS



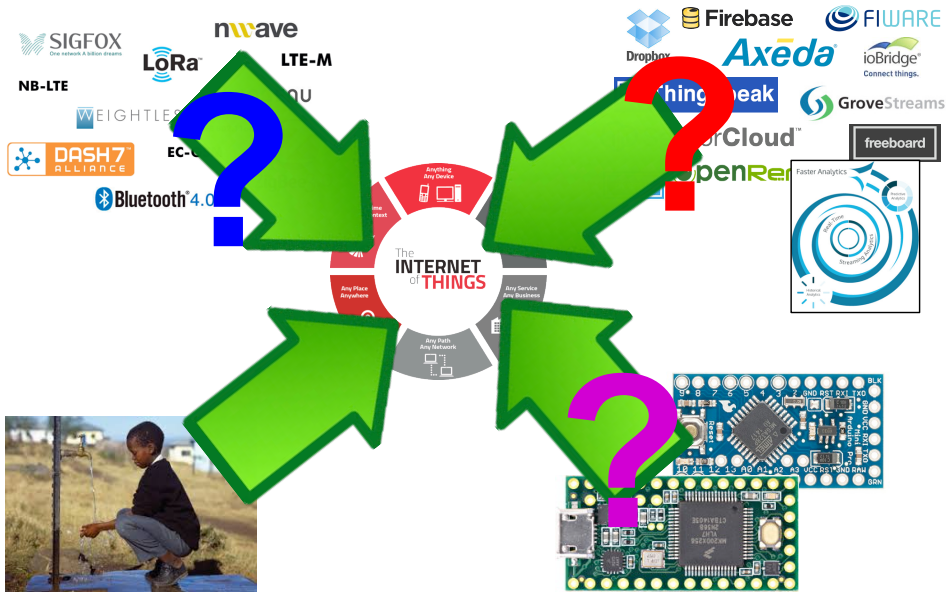


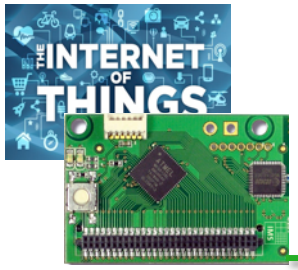


A REALITY FOR EVERYBODY?

IoT in developing countries or rural areas?

- Developing countries/rural areas are still far from being ready to enjoy the smallest benefit of IoT
  - lack of infrastructure
  - high cost of hardware
  - complexity in deployment
  - lack of technological eco-system and background

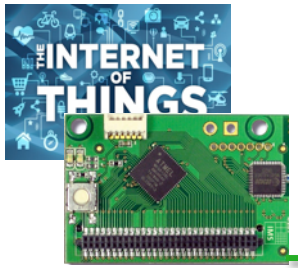




MATURATION OF THE IoT MARKET…

… but not adapted for rural developing countries context & environment

Too expensive
Too integrated
Highly specialized
Difficult to customize
Difficult to upgrade



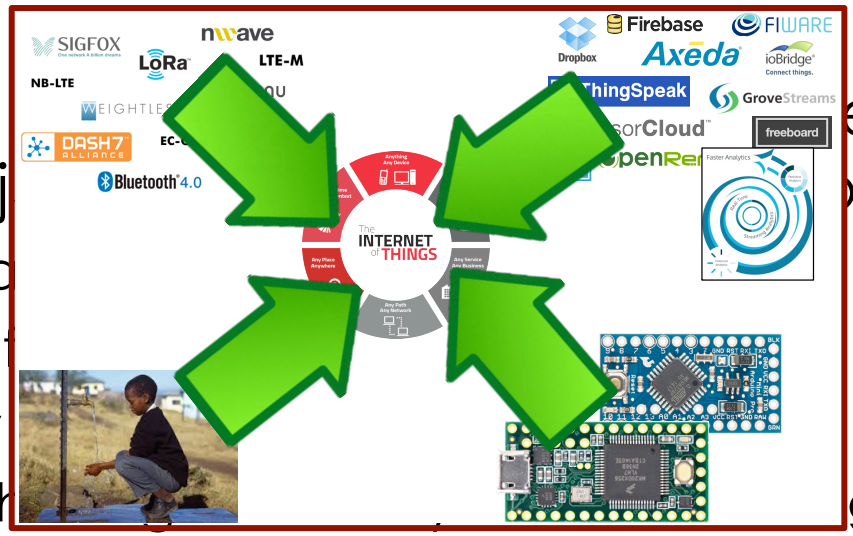
Cloud & big data analytics

Internet connectivity is weak and expensive

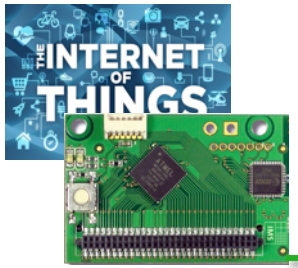
Graphics from http://www.vitria.com/iot-analytics/

IoT IN DEVELOPING COUNTRIES AND RURAL AREAS

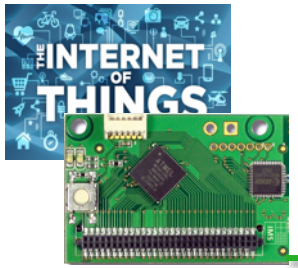
- Developing … eing ready to enj… oT
  - lack of infra…
  - high cost of…
  - complexity …
  - lack of tech… ground



- **to deploy IoT in developing countries, it is necessary to target three major issues**
  - **reduce cost of infrastructures, hardware and services**
  - **limit dependancy to proprietary infrastructures and provide local interaction models**
  - **target technology appropriation, push for local business models**



WAZIUP: LOW-COST IOT



Low-cost hardware

WHAT IS ARDUINO?

Arduino is an open-source electronics platform based on easy-to-use hardware and software. It's intended for anyone making interactive projects.

ARDUINO BOARD

Arduino senses the environment by receiving inputs from many sensors, and affects its surroundings by controlling lights, motors, and other actuators.

```
void setup() {
}

void loop() {
}
```

ARDUINO SOFTWARE

You can tell your Arduino what to do by writing code in the Arduino programming language and using the Arduino development environment.

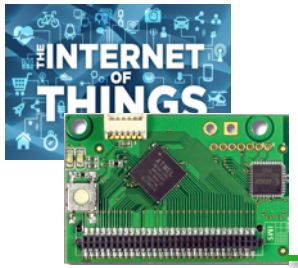
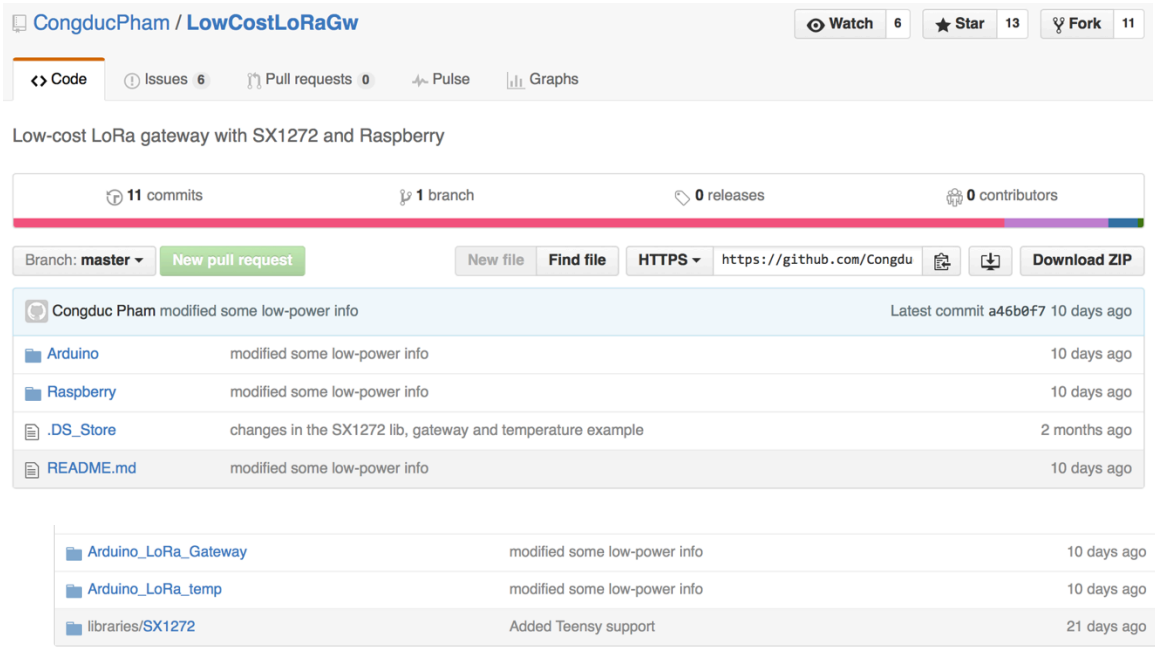
Security

Long-range transmission

Logical sensor management

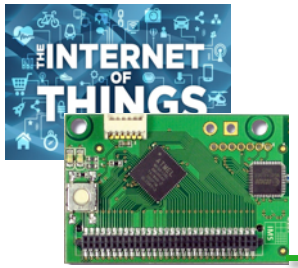


GETTING THE SOFTWARE

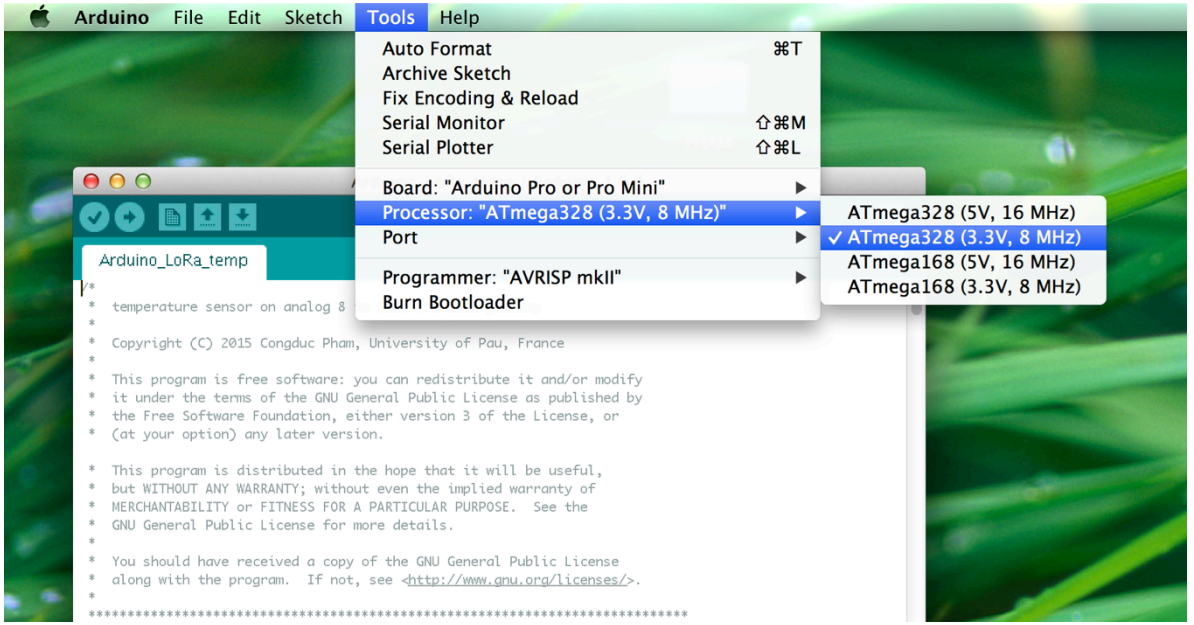


Fisrt, you will need the Arduino IDE 1.6.6 or later (left). Then get the LoRa library from our github: https://github.com/CongducPham/LowCostLoRaGw (right).

Get into the Arduino folder and get both Arduino_LoRa_temp and SX1272 folder. Copy Arduino_LoRa_temp into your “sketch” folder and SX1272 into “sketch/libraries”

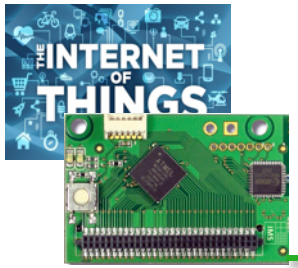


Compiling

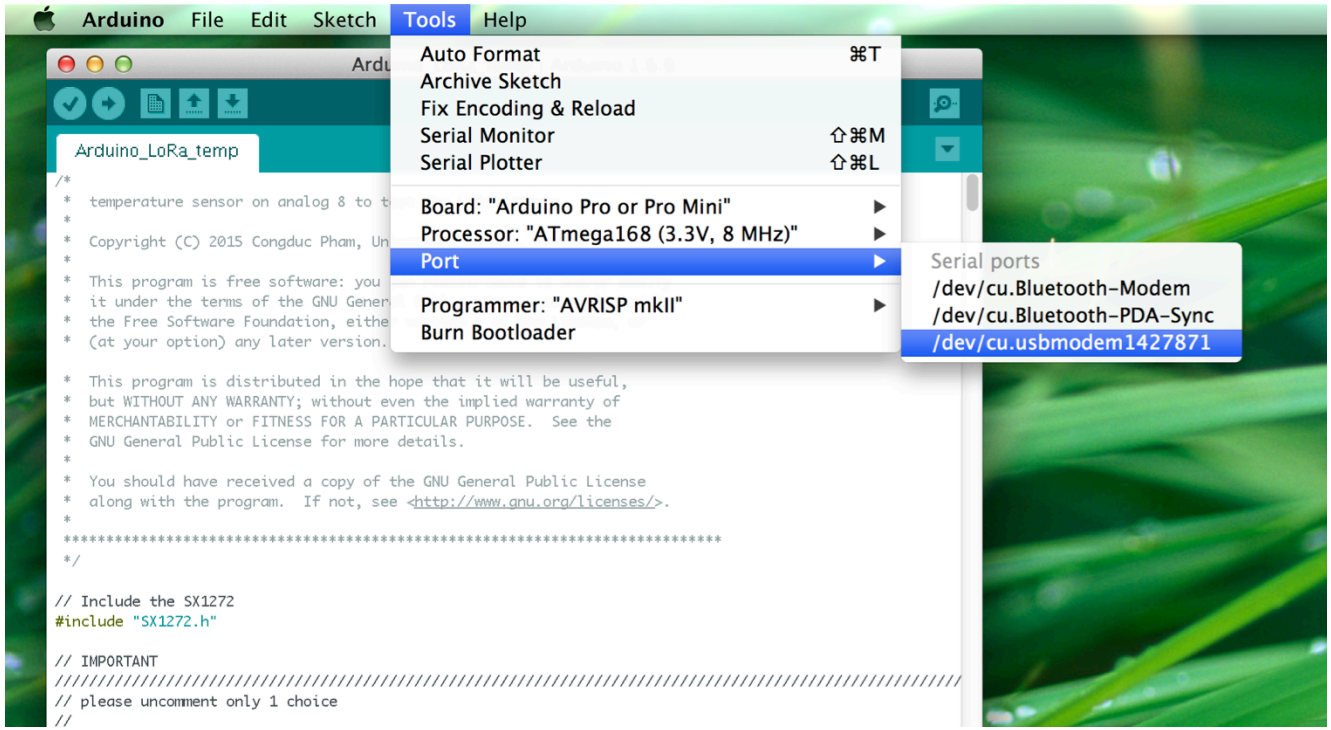


Open the Arduino_LoRa_temp sketch and select the Arduino Pro Mini board with its 3.3V & 8MHz version.

Then, click on the « verify » button

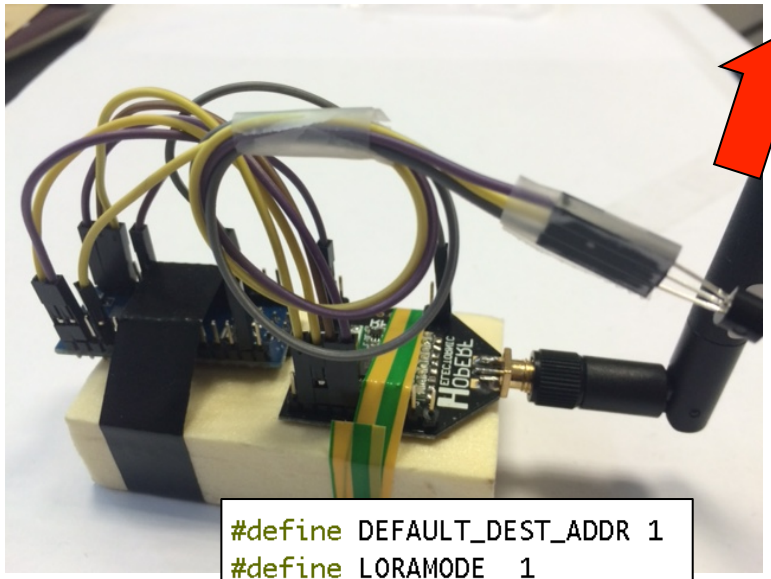


Uploading



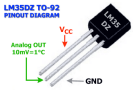
Connect the USB end to your computer and the USB port should be detected in the Arduino IDE. Select the serial port for your device. It may have another name than what is shown in the example. Then click on the « upload » button

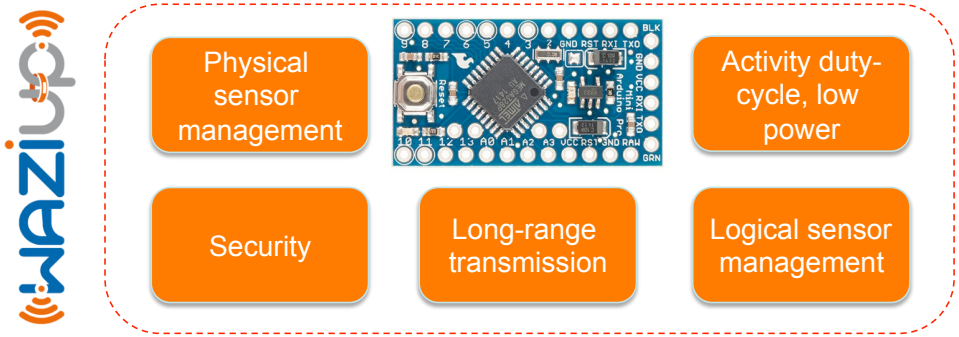
Basic example with temperature sensor



```
#define DEFAULT_DEST_ADDR 1
#define LORAMODE  1
#define node_addr 6
```

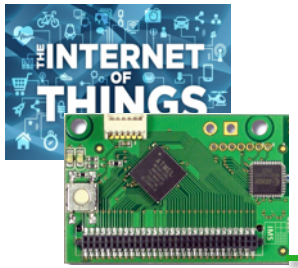
\!##TC/18.5





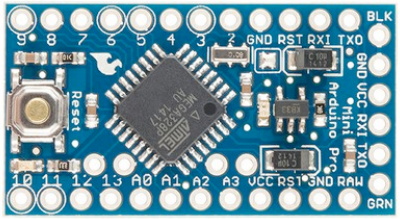
The default configuration in the Arduino_LoRa_temp example is:

Send packets to the gateway (one or many if in range)
LoRa mode 1
Node short address is 6



Easy integration and customization

Arduino Pro Mini



3.3v and 8MHz version

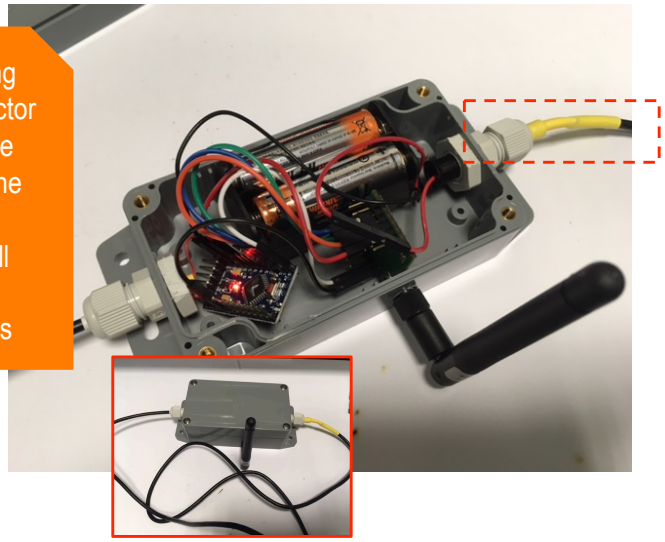
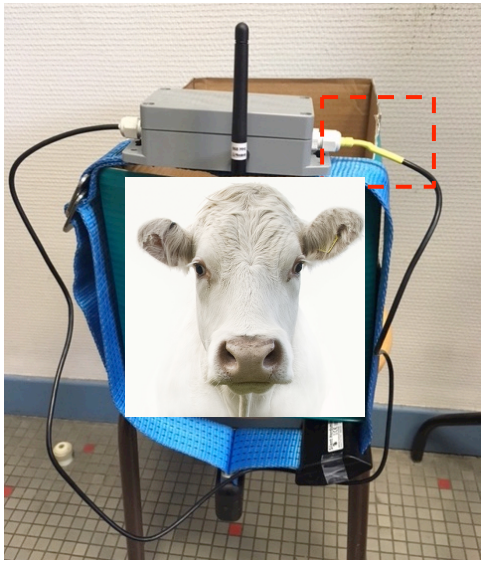
Low-cost collar for cattle rustling

When connecting the male connector MC to the female connector FC, the board will be powered and will start sending periodic beacons

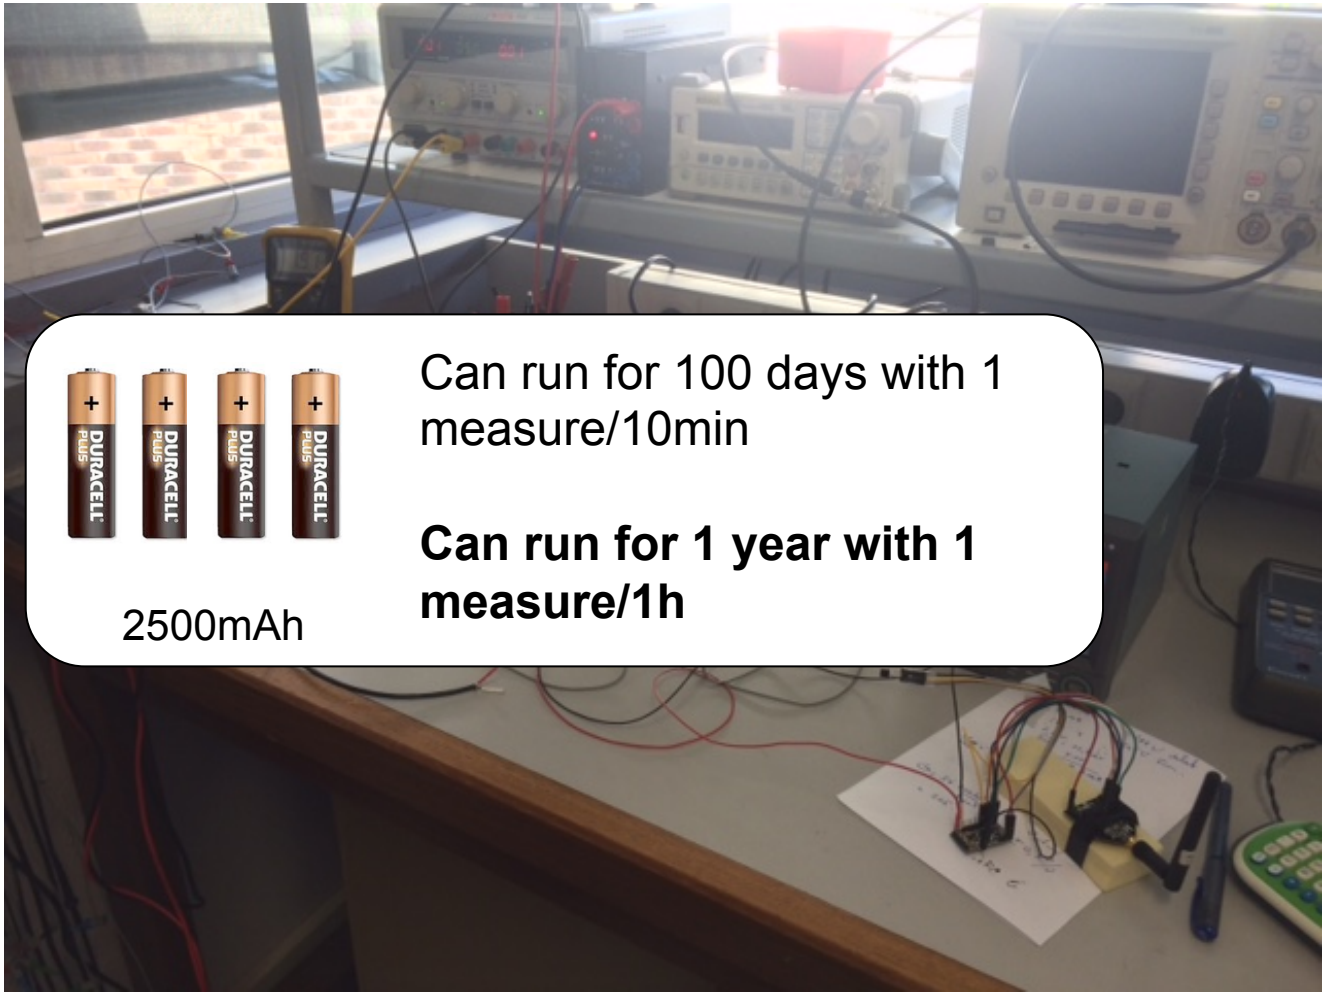


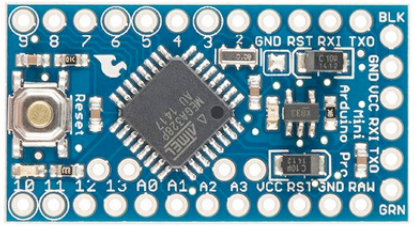


- The collar will be fixed to the cow, around neck. Example picture from Afimilk Silent Herdsman for health monitoring
- In our case, reception of beacon means that the cattle is in range
- If out-of-range, disconnected or damaged device, an alarm can be raised
- To detect collar cutting, the power wire will also goes around the catlle's neck

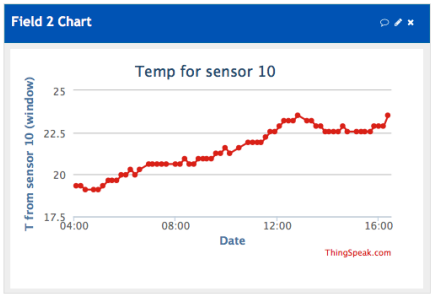
Running for 1 year with low-power mode!

Low-Power library from RocketScream





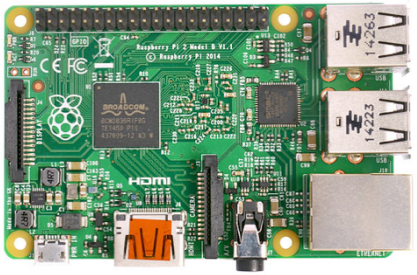
Wakes-up every 10min, take a measure (temp) and send to GW



120µA in deep sleep mode, 93mA when active and sending

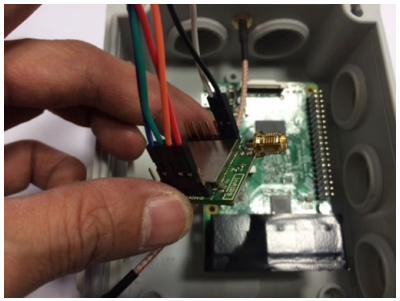
Thanks to T. Mesplou and P. Plouraboué for their help

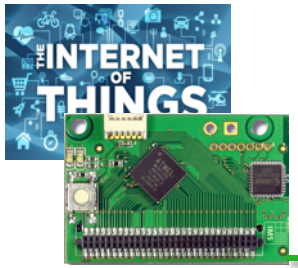
Raspberry-based LoRa gateway



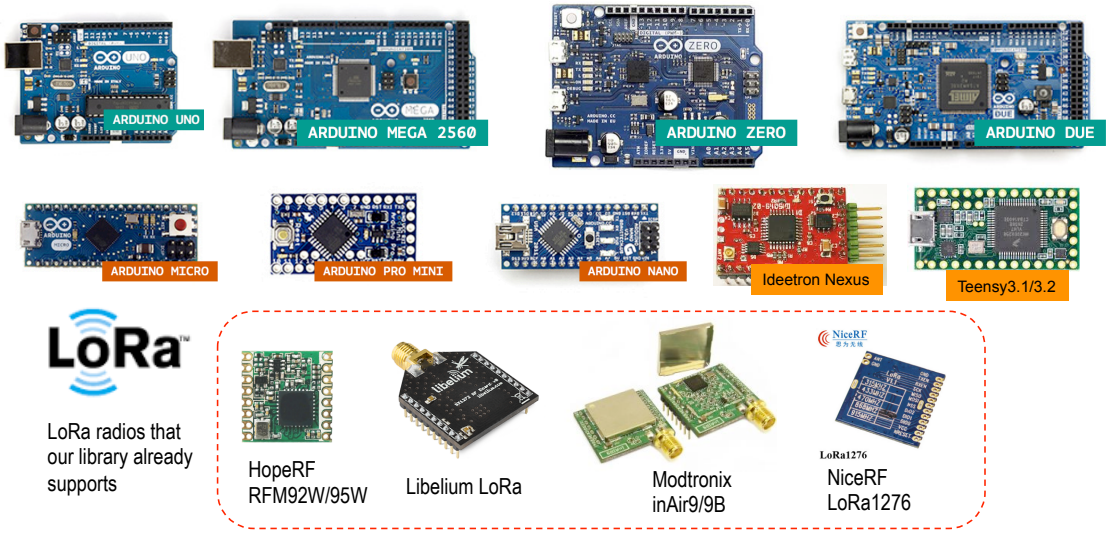
We can use all model of Raspberry. The most important usefull feature is the Ethernet interface for easy Internet connection. Then WiFi and Bluetooth can be added with USB dongles.
RPI3 provides built-in Ethernet, WiFi and Bluetooth!

Less than 50€





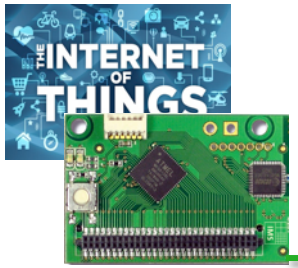
Simplicity!



Long-Range communication library

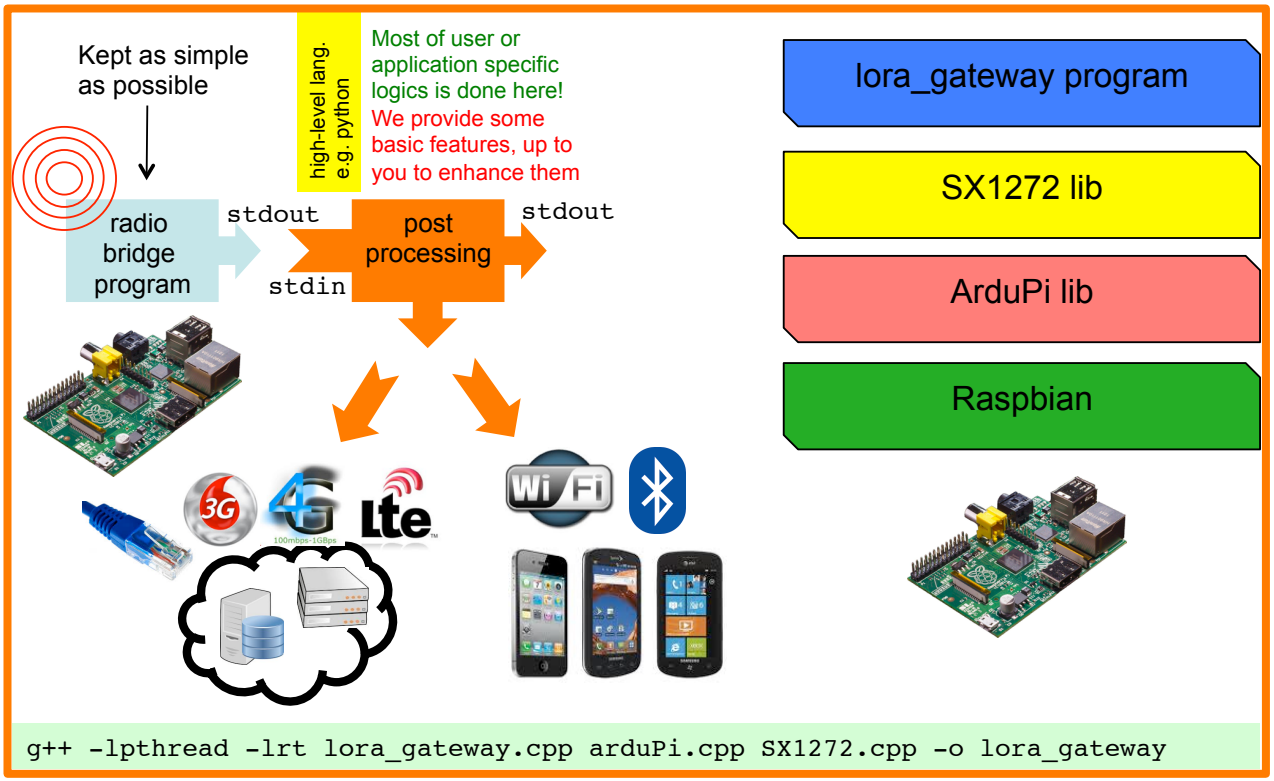
```
sendPacketTimeout("18.5");
// sends to gateway
// 18.5 : temperature message
```

1 send function!



From GW to Cloud platforms

Once data is received at gateway, traditional Internet tools can be used to push data to cloud



- High-level scripting language provides connectivity to any cloud platforms depending on end-user needs

Quality of Service for Long Range Radio?

Regulations stipulate that radio activity duty-cycle should be enforced at devices and that end-users should not be able to modify it « easily ».

LoRaWAN specification from LoRa Alliance is a first attempt to standardize LoRa networks but no issues on quality of service.

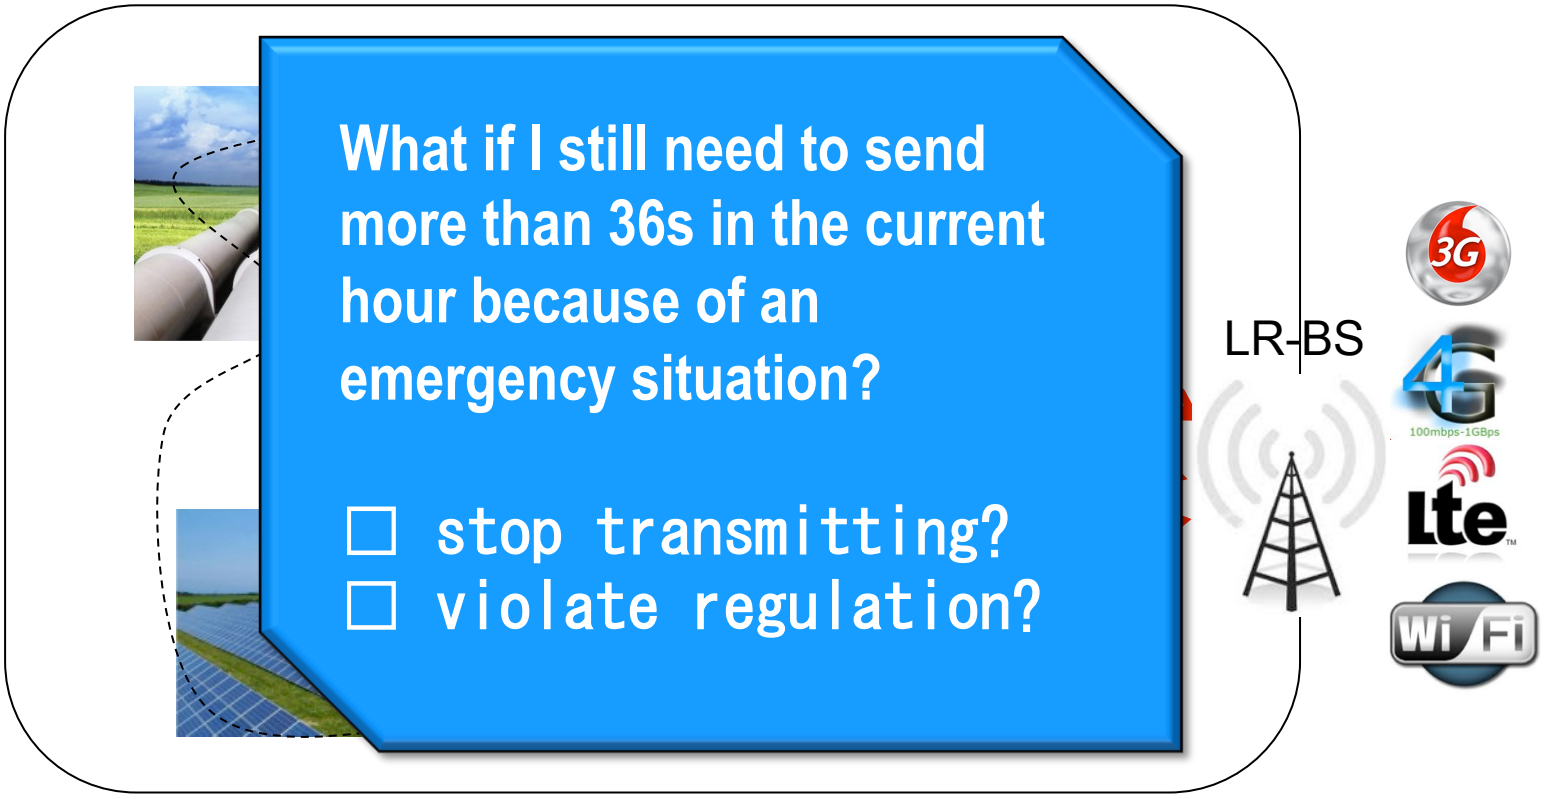

IMAGE SENSOR WITH LONG RANGE RADIO

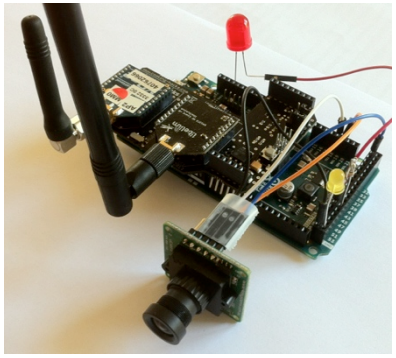
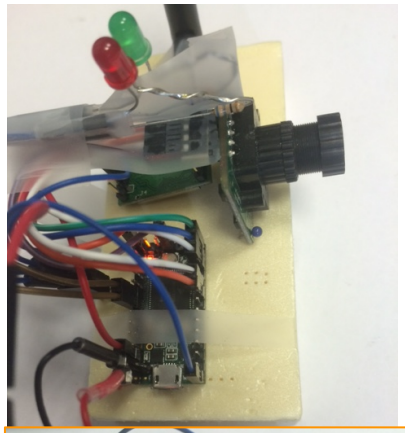
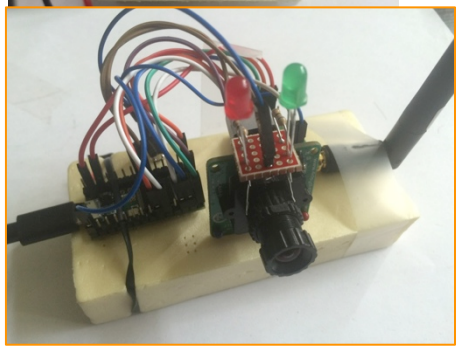
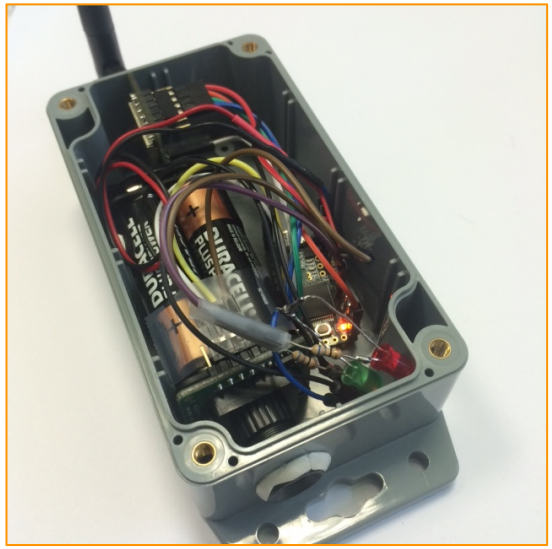
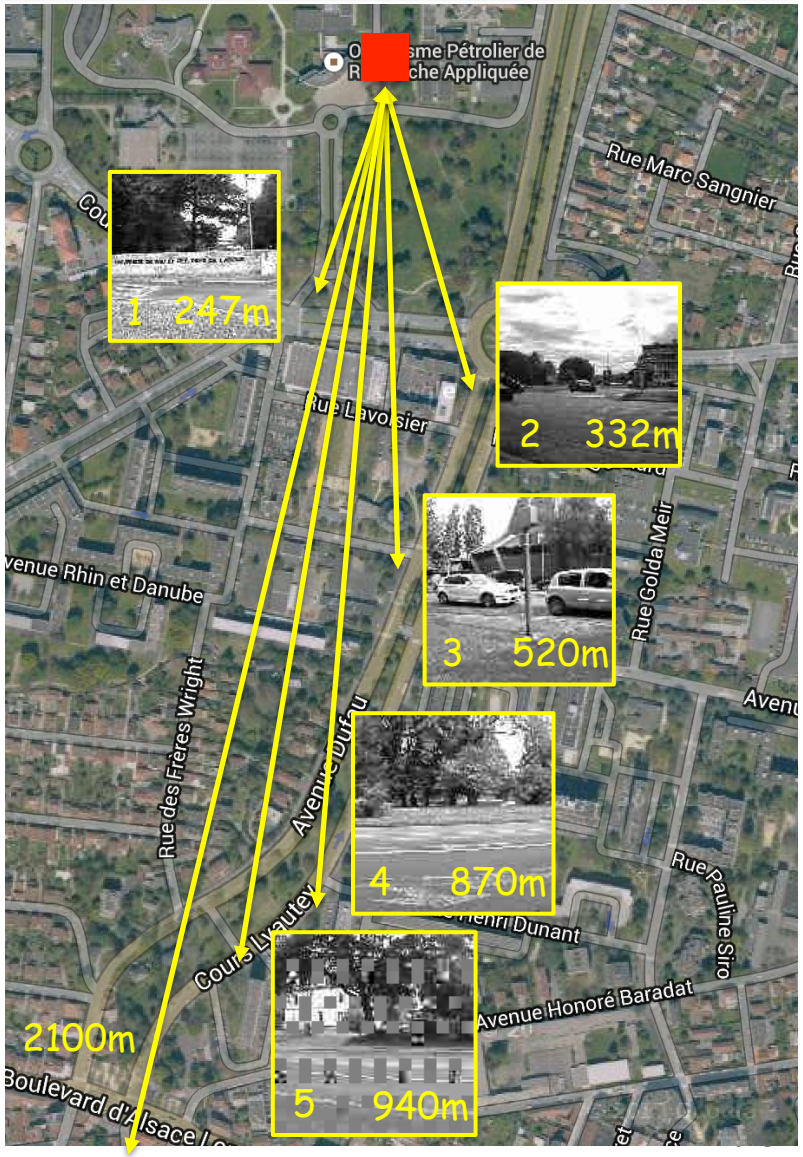


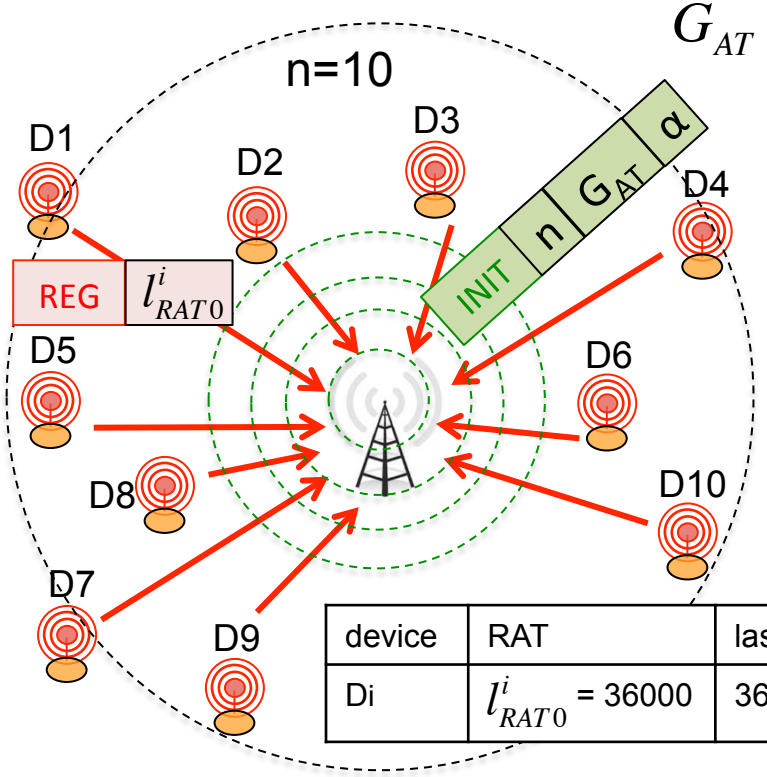






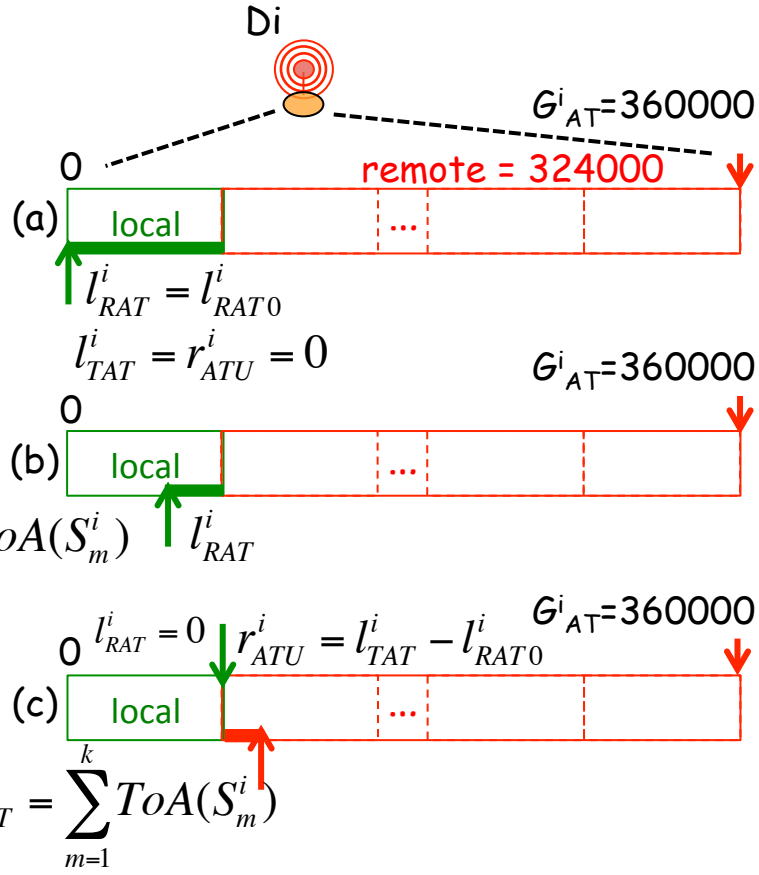


Long-range Activity Sharing (LAS)



device	RAT	lastRAT
Di	l^i_{RAT0} = 36000	36000

$$G_{AT} = \sum_{i=1}^{n} l^i_{RAT0}$$

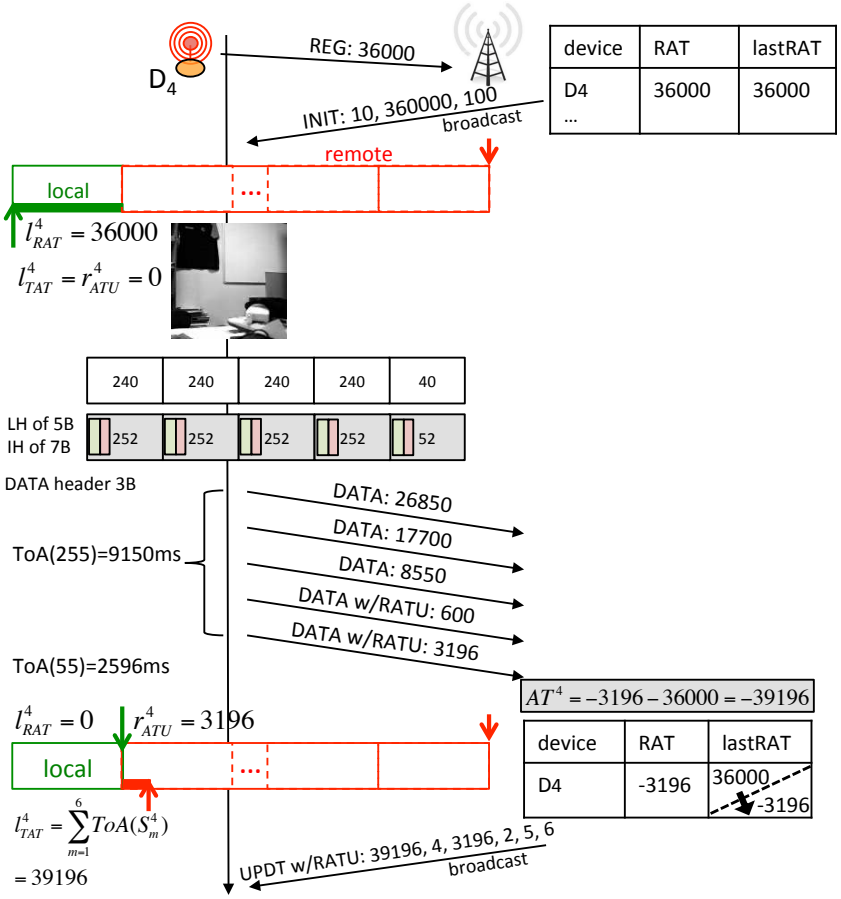


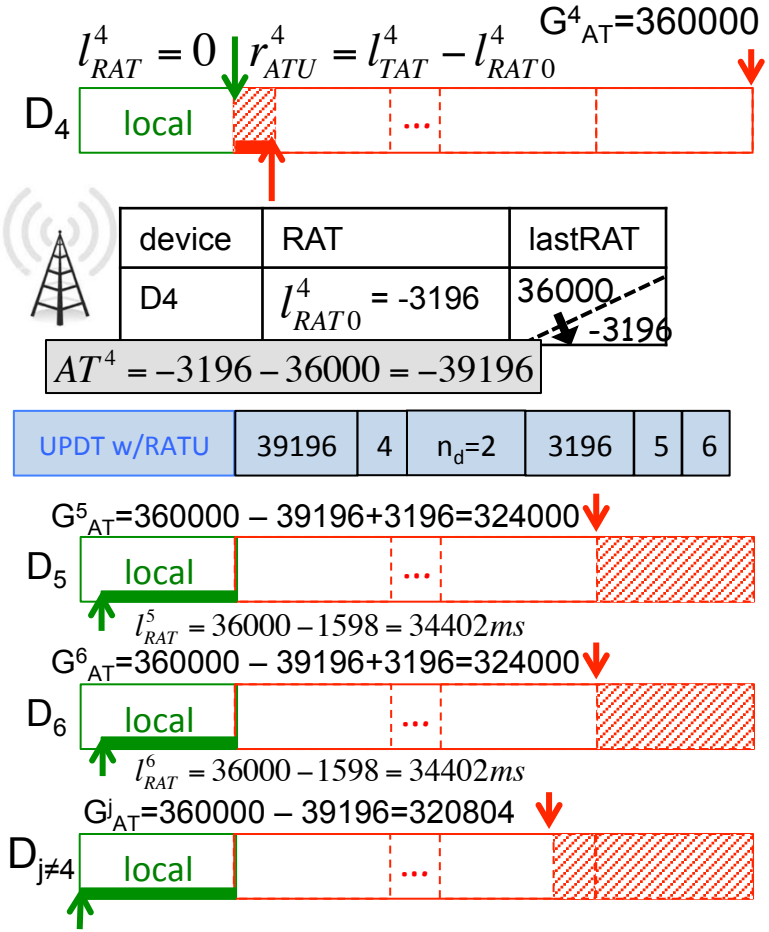
$$l^i_{TAT} = \sum_{m=1}^{k} ToA(S^i_m)$$

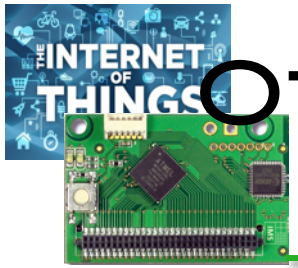
$$l^i_{TAT} = \sum_{m=1}^{k} ToA(S^i_m)$$

A device can transmit more if needed, provided that other devices will decrease their radio activity time accordingly.

Distributing Remote Activity Time Usage

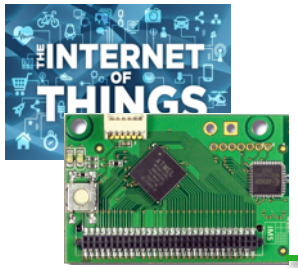




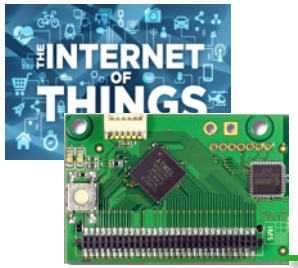


OTHER ISSUES TO TAKE INTO ACCOUNT

- Minimise the number of UPDT messages sent by the gateway because the gateway's radio time is also limited
  - UPDT can have cumulative behavior if no remote activity time has been used
- Support sleep periods of end-devices
  - The network is synchronized for control messages (REG, INIT, UPDT). UPDT msg that can not use cumulative behavior are queued for transmission at next transmission slot. At rcv, UPDT have to be applied sequentially.
- Maintain (loose) synchronization
  - If no UDPT are scheduled, the gateway periodically sends a BEACON. Clock drift is limited to a BEACON period
- Dynamic insertion of new end-devices
  - New devices can either stay out of the managed pool (then only 36s of activity time/h is allowed), or join by waiting for the next UPDT/BEACON msg
  - Every hour, end-devices decide if they want to join the pool or not
- Give priority to control msg
  - SIFS/DIFS mechanism are implemented using LoRa Channel Activity Detection
- Avoid interleaving of several image transmissions
  - Use DIFS for first image packet, then SIFS
- Improve LoRa network efficiency
  - Move from pure ALOHA to CSMA mechanism with CAD+RSSI tests prior to any transmission



ADDED-VALUE



Involving innovation hubs/stakeholders

- **Close to dev & entrepreneurs** communities
- Have their **own community and com channels** (community builders & catalysts)
- Used to organizing disruptive events
- **On the field** (know the targets personaly & the market)
- **Used to empowering startups & businesses** (coaching, business dev, incubation, acceleration…)
- Affiliated to **international networks** that could be involved in dissemination or Business dev (Afrilabs)

Low-cost LoRa IoT devices and gateway FAQ

1) What is Internet-of-Thing (IoT)?

From IERC (European Research Cluster on the Internet of Thing)

The IERC definition states that IoT is "A dynamic global network infrastructure with self-configuring capabilities based on standard and interoperable communication protocols where physical and virtual "things" have identities, physical attributes, and virtual personalities and use intelligent interfaces, and are seamlessly integrated into the information network."

From http://www.gartner.com/it-glossary/internet-of-things/

"The Internet of Things (IoT) is the network of physical objects that contain embedded technology to communicate and sense or interact with their internal states or the external environment."

From http://internetofthingsagenda.techtarget.com/definition/Internet-of-Things-IoT

"The Internet of Things (IoT) is a system of interrelated computing devices, mechanical and digital machines, objects, animals or people that are provided with unique identifiers and the ability to transfer data over a network without requiring human-to-human or human-to-computer interaction."

2) What is WAZIUP?

The EU H2020 WAZIUP project, namely the Open Innovation Platform for IoT-Big Data in Sub-Saharan Africa is a collaborative research project using cutting edge technology applying IoT and Big Data to improve the working conditions in the rural ecosystem of Sub-Saharan Africa. First, WAZIUP operates by involving farmers and breeders in order to define the platform specifications in focused validation cases. Second, while tackling challenges which are specific to the rural ecosystem, it also engages the flourishing ICT ecosystem in those countries by fostering new tools and good practices, entrepreneurship and start-ups. Aimed at boosting the ICT sector, WAZIUP proposes solutions aiming at long term sustainability.

WAZIUP will deliver a communication and big data application platform and generate locally the know how by training by use case and examples. The use of standards will help to create an interoperable platform, fully open source, oriented to radically new paradigms for innovative application/services delivery. WAZIUP is driven by the following visions:

1. Empower the African Rural Economy. Develop new technological enablers to empower the African rural economy now threatened by the concurrent action of rapid urbanization and of climate change. WAZIUP technologies can support the necessary services and infrastructures to launch agriculture and breeding on a new scale;

Conclusions

- Low-power, long-range transmission is a break-through technology for IoT and large-scale deployment of wireless (sensor) devices
- Coupled with low-cost, off-the-shelves hardware, IoT design is entering the DIY era
- The whole IoT eco-system is becoming mature with availability of IoT clouds and advanced big data analytic platforms/frameworks
- As IP and TCP provided tools for building more advanced applications in the early Internet, the whole IoT ecosystem can boost innovative IoT developments and deployments, in all countries!
